

Charm and beauty hadron decays at Belle and Belle II

Justin Skorupa, on behalf of the Belle II collaboration

LLWI 2024, Lake Louise

2024.02.21

Outline

Charm Decays:

- ▶ CP violation in charm
- ▶ Charm flavor tagging

Hadronic B Decays:

- ▶ Hadronic B decays as tool for semileptonic B decays
- ▶ Determination of CKM angle ϕ_3/γ and ϕ_2/α
- ▶ SM Null Tests

Too many results to fit all into this presentation

Japanese dish: *Okonomiyaki*; *okonomi* "as you wish"

Presenting my own heavily biased *okonomiyaki* of charm and beauty results

CP violation in charm

Triple product asymmetries

PRD 108, L111102 (2023)

B Factories are also charm factories 1.3 M $c\bar{c}$ events per 1 fb^{-1} (1.1 M for $B\bar{B}$)

Search for CP -violation in $D_{(s)}^+ \rightarrow K^+ K_S^0 h^+ h^-$ at Belle

Measure asymmetry in triple products

$$C_T = v_1 \cdot (v_2 \times v_3)$$

$$A_T = \frac{\Gamma(C_T > 0) - \Gamma(C_T < 0)}{\Gamma(C_T > 0) + \Gamma(C_T < 0)}; \quad \bar{A}_T = \frac{\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)}{\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)}$$

$A_T \neq 0$ also due to final state interaction

Define $a_{CP}^{T\text{-odd}} = 0.5(A_T - \bar{A}_T)$ to remove this effect

| Mode | $N(D_{(s)}^+)$ | $a_{CP}^{T\text{-odd}}$ (%) |
|---|-----------------|-----------------------------|
| $D^+ \rightarrow K^+ K_S^0 \pi^+ \pi^-$ | 18632 ± 214 | $(0.34 \pm 0.87 \pm 0.32)$ |
| $D_s^+ \rightarrow K^+ K_S^0 \pi^+ \pi^-$ | 70080 ± 676 | $(-0.46 \pm 0.63 \pm 0.38)$ |
| $D^+ \rightarrow K^+ K^- K_S^0 \pi^+$ | 1425 ± 44 | $(-3.34 \pm 2.66 \pm 0.35)$ |

\Rightarrow All results consistent with no CP -violation

Triple product asymmetries

Using same approach as before: Search for T -violation in $D_{(s)}^+ \rightarrow K^+ K^- \pi^+ \pi^0$,

$D_{(s)}^+ \rightarrow K^+ \pi^- \pi^+ \pi^0$, and $D^+ \rightarrow K^- \pi^+ \pi^+ \pi^0$ decays at Belle

\Rightarrow First measurements for these decays; All results consistent with no CP -violation

Charm flavor tagging

Charm Flavor Tagging

PRD 107, 112010 (2023)

Need to know D^0 flavor for CP -violation measurements

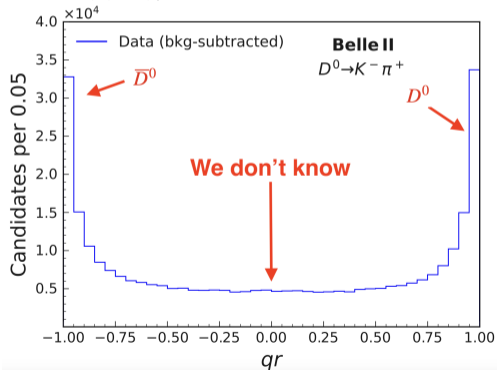

Since 1977, achieved by exclusively reconstruction $D^{*+} \rightarrow D^0 \pi^+$

\Rightarrow Clean sample **but** low efficiency

New approach: Train BDT based on kinematic and particle identification information from opposite side c (inspired by b flavor tagging)

$$\epsilon = (47.91 \pm 0.07(\text{stat}) \pm 0.51(\text{syst}))\%$$

- Doubles sample size compared to old method

Hadronic B decays as tool for semileptonic
 B decays

Measurement of $B \rightarrow D^{(*)}K^-K_S^0$

Roughly 30% of $B \rightarrow$ hadron decays are not measured

⇒ Limits performance of the hadronic tag

Total BF of $B \rightarrow D^{(*)}K^{(*)}K^{(*)}$ could be up to 6%, but only 0.3% is known + High purity

⇒ Candidates to be included in hadronic tag

$$B(B^- \rightarrow D^0 K^- K_S^0) = (1.89 \pm 0.16 \pm 0.10) \times 10^{-4}$$

$$B(\bar{B}^0 \rightarrow D^+ K^- K_S^0) = (0.85 \pm 0.11 \pm 0.05) \times 10^{-4}$$

$$B(B^- \rightarrow D^{*0} K^- K_S^0) = (1.57 \pm 0.27 \pm 0.12) \times 10^{-4}$$

$$B(\bar{B}^0 \rightarrow D^{*+} K^- K_S^0) = (0.96 \pm 0.18 \pm 0.06) \times 10^{-4}$$

3 first observations

Determination of CKM angle ϕ_3/γ and ϕ_2/α

Determination of CKM angle ϕ_3/γ

phase between $b \rightarrow u$ and $b \rightarrow c$ transitions

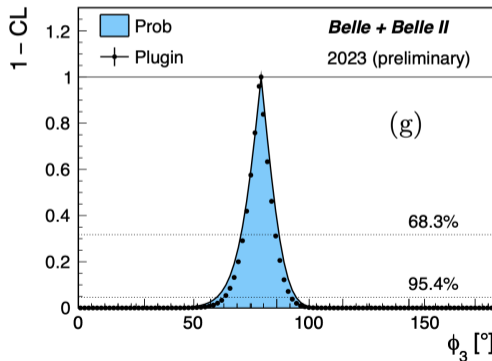

tree level only, negligible theory uncertainty

Several Belle + Belle II measurements:

- ▶ $D \rightarrow K_S^0 hh$ [JHEP 02 (2022) 063]
- ▶ $D \rightarrow K_S^0 K \pi$ [2306.02940]
- ▶ $D \rightarrow K_S^0 \pi^0, KK$ [2308.05048]

New determination of γ using only Belle and Belle II measurements:

$$\gamma = (78.6 \pm 7.3)^\circ$$

Towards CKM angle ϕ_2/α

Least well known angle of CKM triangle

Accessible in tree level $B^0 \rightarrow \pi^+\pi^-$ transitions but sizable loop level contribution introduces shift

Remove shift using \mathcal{B} and \mathcal{A}^{CP} of isospin related $B^+ \rightarrow \pi^+\pi^0$ and $B^0 \rightarrow \pi^0\pi^0$

Belle II is a unique place to measure all involved decays!

$$\mathcal{B} = (5.83 \pm 0.33(\text{stat}) \pm 0.17(\text{syst})) \times 10^{-6}$$

$$\mathcal{A}^{\text{CP}} = 0.081 \pm 0.54(\text{stat}) \pm 0.008(\text{syst})$$

$$\mathcal{B} = (5.10 \pm 0.29(\text{stat}) \pm 0.32(\text{syst})) \times 10^{-6}$$

World best result for BF of $B^0 \rightarrow \pi^+ \pi^-$

Result of $\mathcal{B} B^+ \rightarrow \pi^+ \pi^0$ limited by π^0 systematic

SM Null Tests

Combination of $B \rightarrow K\pi$ decays offers SM null test [Phys.Lett.B 627 (2005) 82-88]:

$$\mathcal{A}_{K^+\pi^-}^{\text{CP}} + \mathcal{A}_{K^0\pi^+}^{\text{CP}} \frac{\mathcal{B}_{K^0\pi^+}}{\mathcal{B}_{K^+\pi^-}} \frac{\tau_{B^0}}{\tau_{B^+}} - 2\mathcal{A}_{K^+\pi^0}^{\text{CP}} \frac{\mathcal{B}_{K^+\pi^0}}{\mathcal{B}_{K^+\pi^-}} \frac{\tau_{B^0}}{\tau_{B^+}} - 2\mathcal{A}_{K^0\pi^0}^{\text{CP}} \frac{\mathcal{B}_{K^0\pi^0}}{\mathcal{B}_{K^+\pi^-}} \approx 0$$

Theoretical precision: $\mathcal{O}(0.01)$, Experimental precision: $\mathcal{O}(0.1)$

$$\mathcal{A}^{\text{CP}} = (-7.2 \pm 1.9 \text{ (stat)} \pm 0.7 \text{ (syst)})\%$$

$$\mathcal{B} = (20.67 \pm 0.37 \text{ (stat)} \pm 0.6 \text{ (syst)}) \times 10^{-6}$$

$$\mathcal{A}^{\text{CP}} = (1.3 \pm 2.7 \text{ (stat)} \pm 0.5 \text{ (syst)})\%$$

$$\mathcal{B} = (14.21 \pm 0.38 \text{ (stat)} \pm 0.85 \text{ (syst)}) \times 10^{-6}$$

$$\mathcal{A}^{\text{CP}} = (4.6 \pm 2.9 \text{ (stat)} \pm 0.7 \text{ (syst)})\%$$

$$\mathcal{B} = (24.40 \pm 0.71 \text{ (stat)} \pm 0.86 \text{ (syst)}) \times 10^{-6}$$

Understanding of K_S^0 and π^0 systematic at 2% and 5%

Isospin sum-rule

PRD 109, 012001 (2024)

Two analyses of $B^0 \rightarrow K_S^0 \pi^0$ one time-dependent [PRL 131, 111803 (2023)] and one time-integrated. Both are combined to enhance sensitivity.

$$\mathcal{A}^{\text{CP}} = -0.01 \pm 0.12 (\text{stat}) \pm 0.05 (\text{syst})$$

$$\mathcal{B} = (10.50 \pm 0.62 (\text{stat}) \pm 0.67 (\text{syst})) \times 10^{-6}$$

World's best result on \mathcal{A}^{CP}

Putting all together for the null test:

$$-0.03 \pm 0.13 \pm 0.05$$

Competitive with world average -0.13 ± 0.11

Conclusion

Belle is still providing exciting results both standalone and also in combined Belle + Belle II analyses

Belle II is improving its tools

- ▶ Development of new tools using novel ideas
- ▶ (Re)measurements to improve hadronic tagging

Belle II isospin sum-rule result and input measurements for ϕ_2/α already on par with world average

⇒ Sum-rule result is statistically limited, input from Belle II crucial to enhance sensitivity
