17th International Conference on Interconncetions between Partcile Physics and
Cosmology
14 – 18 October 2024

Physics Motivation

- $D^0 \rightarrow K_s K_s$ is a Singly Cabibbo Suppressed (SCS) decay, which involves the interference of $c\bar{u} \rightarrow s\bar{s}$ and $c\bar{u} \rightarrow d\bar{d}$ transitions.

- Due to this interference, the CP Asymmetry (A_{CP}) may be enhanced to an observable level within the Standard Model.
- The world-average determination of $A_{CP}(D^0 \rightarrow K_s K_s)$: $(-1.9 \pm 1.0)\%$, is limited by the statistical precision.
- The world average is dominated by measurements from **Belle** and **LHCb**:
 - Using 921fb^{-1} and $D^0 \rightarrow K_s \pi^0$ as the control mode, Belle measured
 $A_{CP}(D^0 \rightarrow K_s K_s) = (-0.02 \pm 1.53 \text{ (stat.)} \pm 0.02 \text{ (syst.)} \pm 0.17 \text{ (control mode)})\%$ [[Phys. Rev. Lett. 119 171801](#)]
 - A more precise result of A_{CP} is obtained by LHCb with $D^0 \rightarrow K^+ K^-$ as the control mode :
 $A_{CP}(D^0 \rightarrow K_s K_s) = (-3.1 \pm 1.2 \text{ (stat.)} \pm 0.4 \text{ (syst.)} \pm 0.2 \text{ (control mode)})\%$ [[Phys. Rev. D 104, L031102](#)]
- The measurement of $A_{CP}(D^0 \rightarrow K^+ K^-)$ has been recently improved by LHCb bringing the corresponding uncertainty below the 0.1% level [[Phys. Rev. Lett. 131, 091802](#)]

→ Goal of this analysis is to measure the time integrated Asymmetry (A_{CP}) in $D^0 \rightarrow K_s K_s$ Decays using $D^0 \rightarrow K^+ K^-$ as the control mode, with Belle and Belle II data. 2

Time Integrated CP Asymmetry (A_{CP})

- Time integrated A_{CP} is defined as: $A_{CP} \equiv \frac{\Gamma(D^0 \rightarrow K_S^0 K_S^0) - \Gamma(\bar{D}^0 \rightarrow K_S^0 K_S^0)}{\Gamma(D^0 \rightarrow K_S^0 K_S^0) + \Gamma(\bar{D}^0 \rightarrow K_S^0 K_S^0)}$ $\Gamma = \text{partial decay width}$
- Experimentally we measure the quantity of raw asymmetry (A_{raw}), defined as:

$$A_{raw} \equiv \frac{N(D^0) - N(\bar{D}^0)}{N(D^0) + N(\bar{D}^0)}$$

$N(D^0)$ = measured yield of $D^{*+} \rightarrow D^0\pi^+$, $D^0 \rightarrow K_S K_S$ decays
 $N(\bar{D}^0)$ = measured yield of $D^{*-} \rightarrow \bar{D}^0\pi^-$, $\bar{D}^0 \rightarrow K_S K_S$ decays

$$A_{raw} \approx A_{FB}^{D^{*+}} + A_{CP} + A_{\epsilon}^{\pi_s}$$

$A_{\epsilon}^{\pi_s}$ = asymmetry of the detection efficiency of the slow pion

A_{FB} = forward backward asymmetry

$$A_{CP}^{K_S K_S} = (A_{raw}^{K_S K_S} - A_{raw}^{KK}) + A_{CP}^{KK}$$

Assuming that the distributions of $\cos\theta$ and momenta for D^{*+} and π_s are in agreement, due to which, corresponding A_{FB} and A_{ϵ} cancel.

$$A_{CP}(D^0 \rightarrow K^+ K^-) = A_{CP}^{dir}(D^0 \rightarrow K^+ K^-) + \Delta Y = (6.7 \pm 5.4) \times 10^{-4}$$

direct CP Asymmetry

Phys. Rev. Lett. 131 (2023) 091802

asymmetry from CP violation in mixing and in the interference between mixing and decay

Phys. Rev. D104 (2021) 072010

Target dataset: 50 ab^{-1}

Collected till date: 428 fb^{-1}

Instantaneous luminosity: $4.7 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$
(June 2022, current world record)

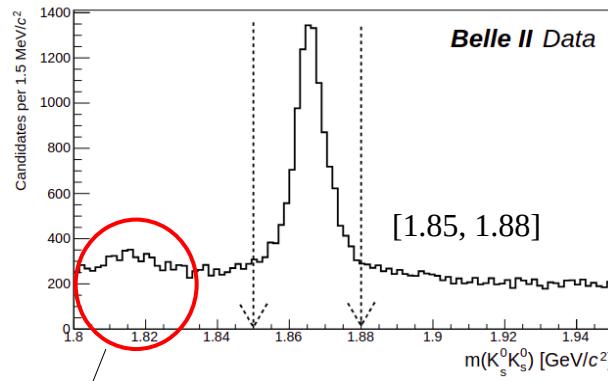

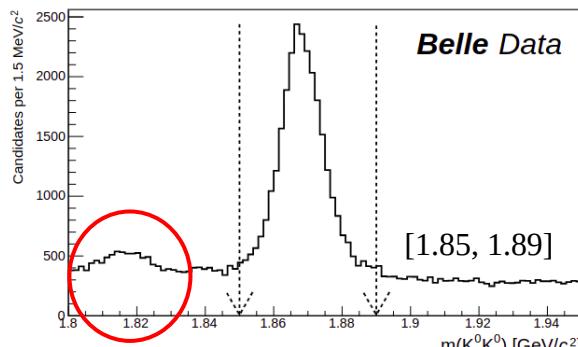

Used data sample collected at 427 fb^{-1} by Belle II (before LS1)

Measurement of the integrated luminosity of data samples collected during 2019-2022 by Belle II experiment arXiv:2407.00965(hep-ex)

Selection Criteria

Variable	Criteria
$ d_r(\pi_s) $	$< 0.5 \text{ cm}$
$ d_z(\pi_s) $	$< 2 \text{ cm}$
$\theta(\pi_s)$	$[17, 150]^\circ$
$m(\pi^+ \pi^-)$	$[0.45, 0.55] \text{ GeV}/c^2$
$m(K_s^0 K_s^0)$	$[1.85, 1.89] \text{ GeV}/c^2$ (Belle) or $[1.85, 1.88] \text{ GeV}/c^2$ (Belle II)
$\Delta m = (m(D^{*+}) - m(D^0))$	$< 0.16 \text{ GeV}/c^2$
$p_{\text{cms}}(D^{*+})$	$> 2.5 \text{ GeV}/c$ → (To reduce the events where D^{*+} coming from B meson)
TreeFitter probability	> 0.001
Best-candidate selection	D^{*+} candidate with largest TreeFitter probability

Treefitter is used with K_s mass constraint and IP constraint

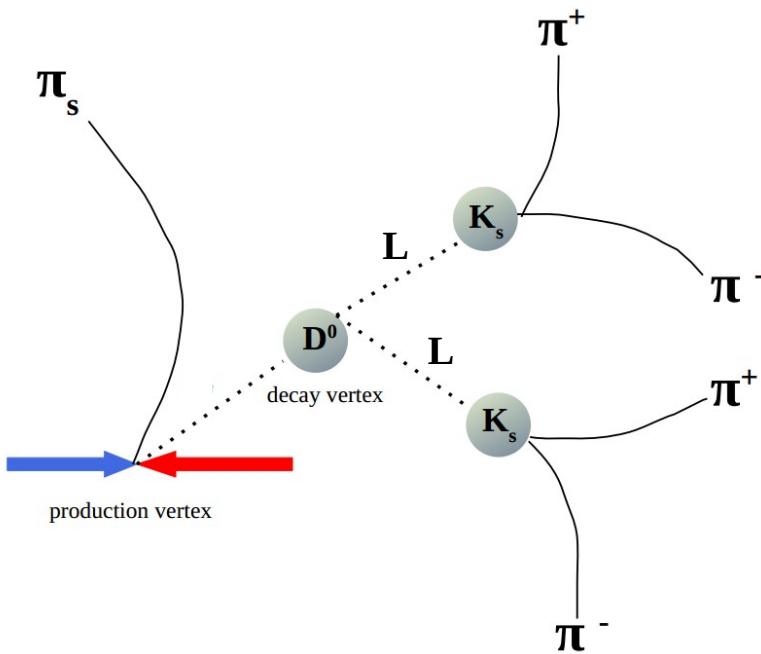

$D_s \rightarrow K_s K_s \pi^+$ ($B = 7.7 \times 10^{-3}$), in which the charged pion acts as soft pion candidate.

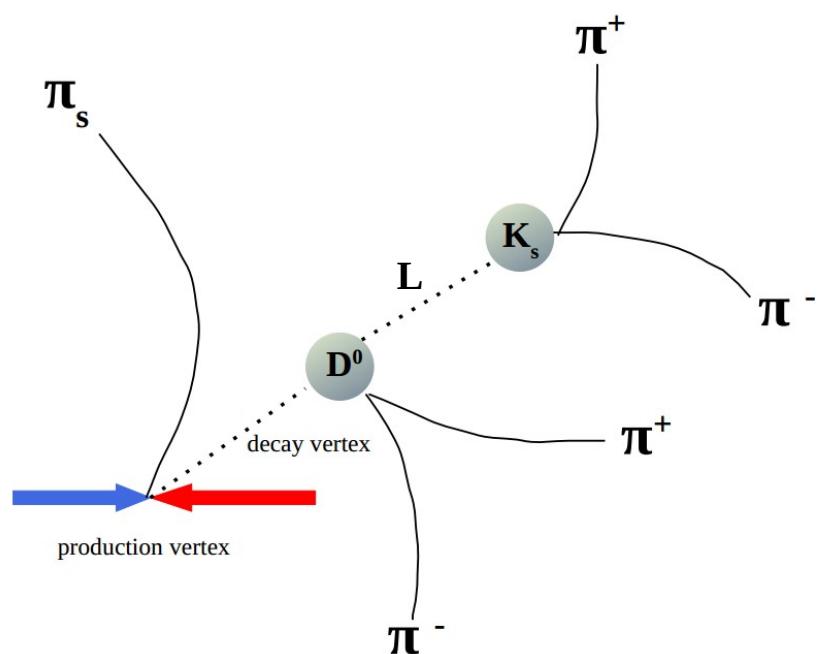

$D^0 \rightarrow 2\pi^+ 2\pi^-$ is negligible and the only remaining physics background is $D^0 \rightarrow K_s \pi^+ \pi^-$

The background rejection variable S_{min}

$$D^0 \rightarrow K_s K_s$$

$$D^0 \rightarrow K_s \pi^+ \pi^-$$

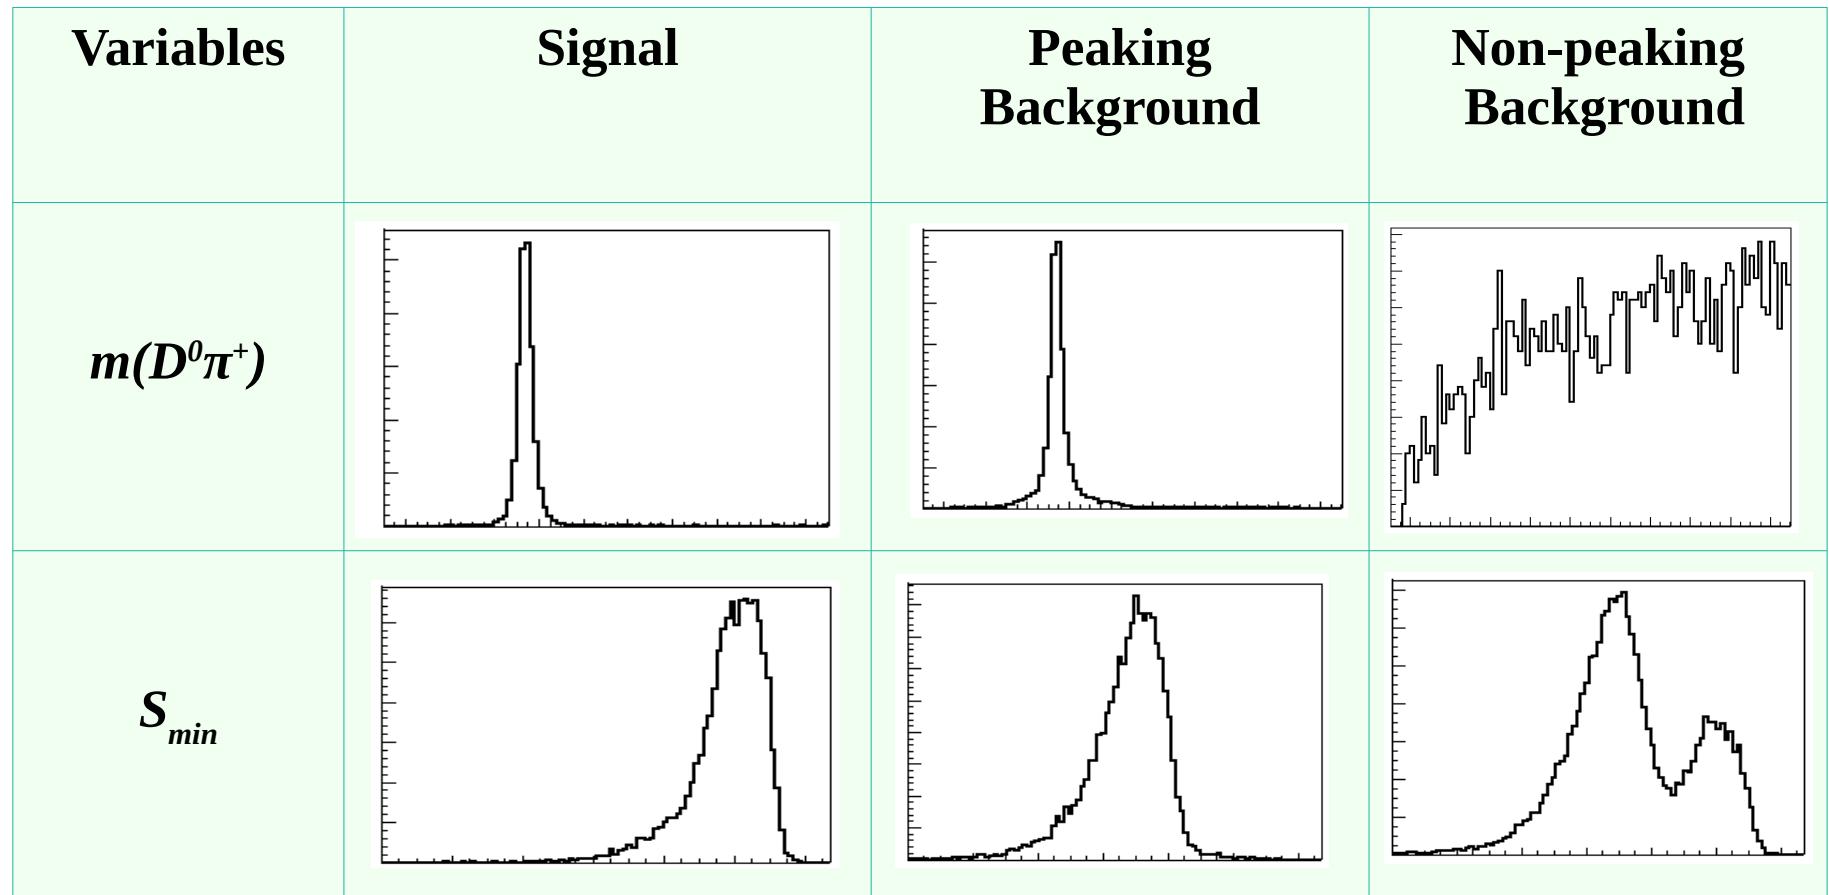

The flight distance of the K_s (with respect to the D^0 vertex) is exploited to provide separation of the peaking background ($D^0 \rightarrow K_s \pi^+ \pi^-$) from the signal ($D^0 \rightarrow K_s K_s$). S_{min} is used in the fit (no cut on S_{min} is applied).

$$S_{min} = \log(\min_i (L_i / \sigma_i))$$

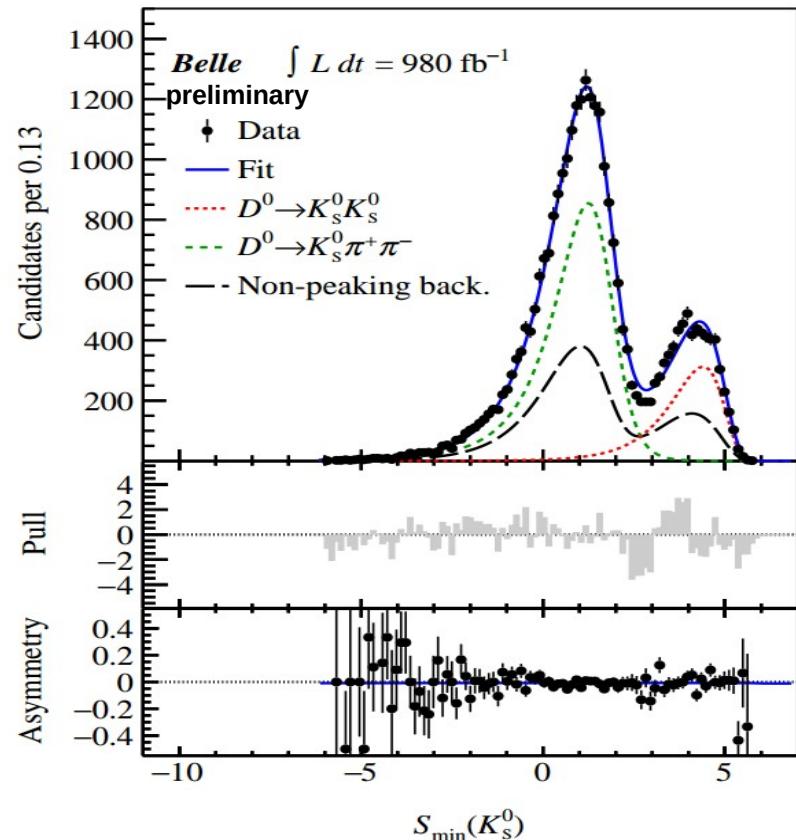

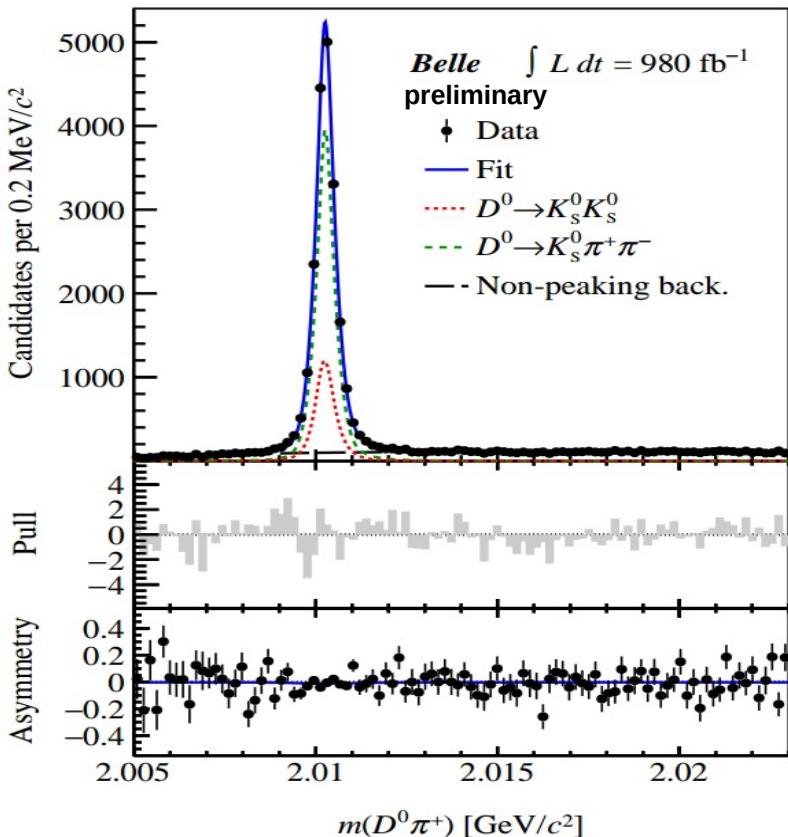

where, i runs over the K_s candidates.

Sample Composition ($D^0 \rightarrow K_s K_s$)

- Asymmetry determined from unbinned fit to (m, S_{min}) distributions of D^0 and \bar{D}^0 candidates.
- Shapes determined from either simulation or sideband data, assumed to be the same for D^0 and \bar{D}^0 decays. 7

Fit projections for Belle Data

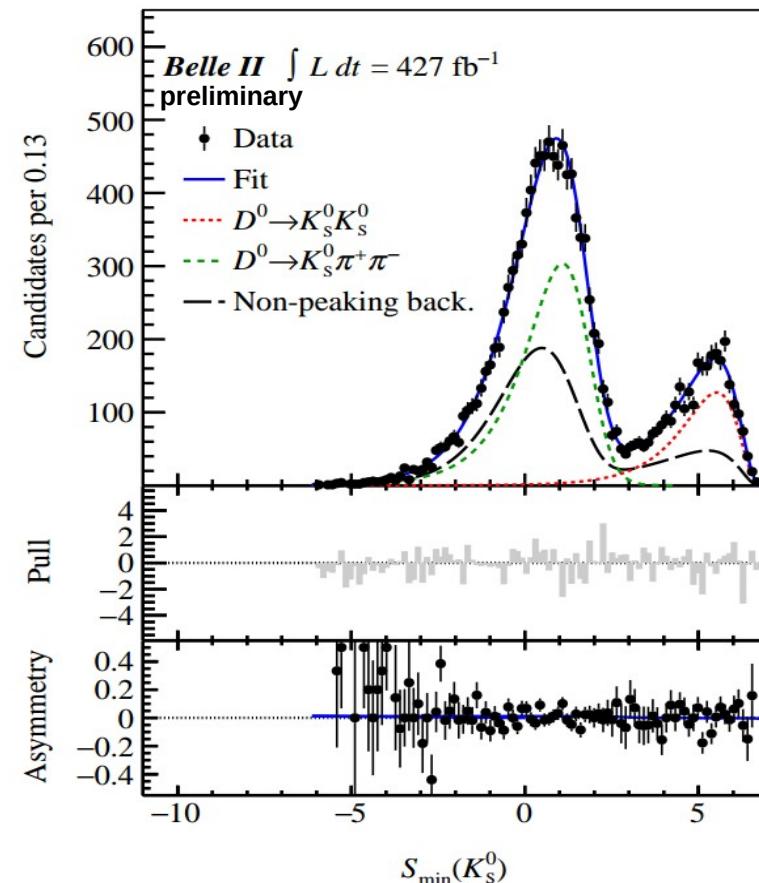

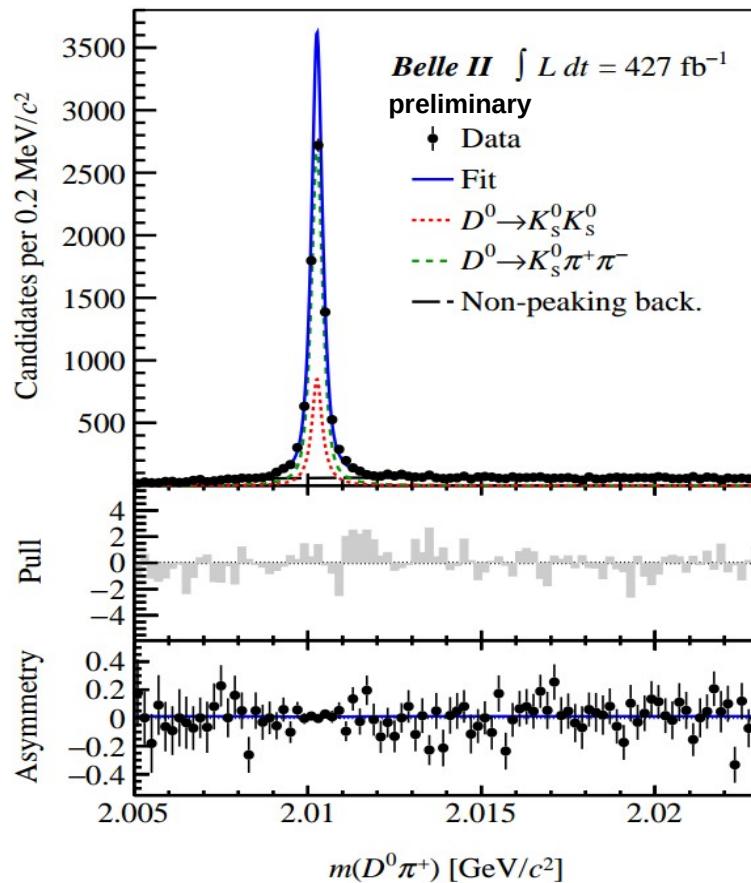

The fit model describes the data well in Belle, except in the region around $S_{\min}(K_s^0) = 3.5$.

Fit to data:

- $N(D^0 \rightarrow K_s K_s) = 4,864 \pm 78$
- $A_{\text{raw}}(D^0 \rightarrow K_s K_s) = (-1.0 \pm 1.6)\%$

Fit projections for Belle II Data

The fit model describes the data well in Belle II

- $N(D^0 \rightarrow K_s^0 K_s^0) = 2,214 \pm 51$
- $A_{\text{raw}}(D^0 \rightarrow K_s^0 K_s^0) = (-0.6 \pm 2.3)\%$

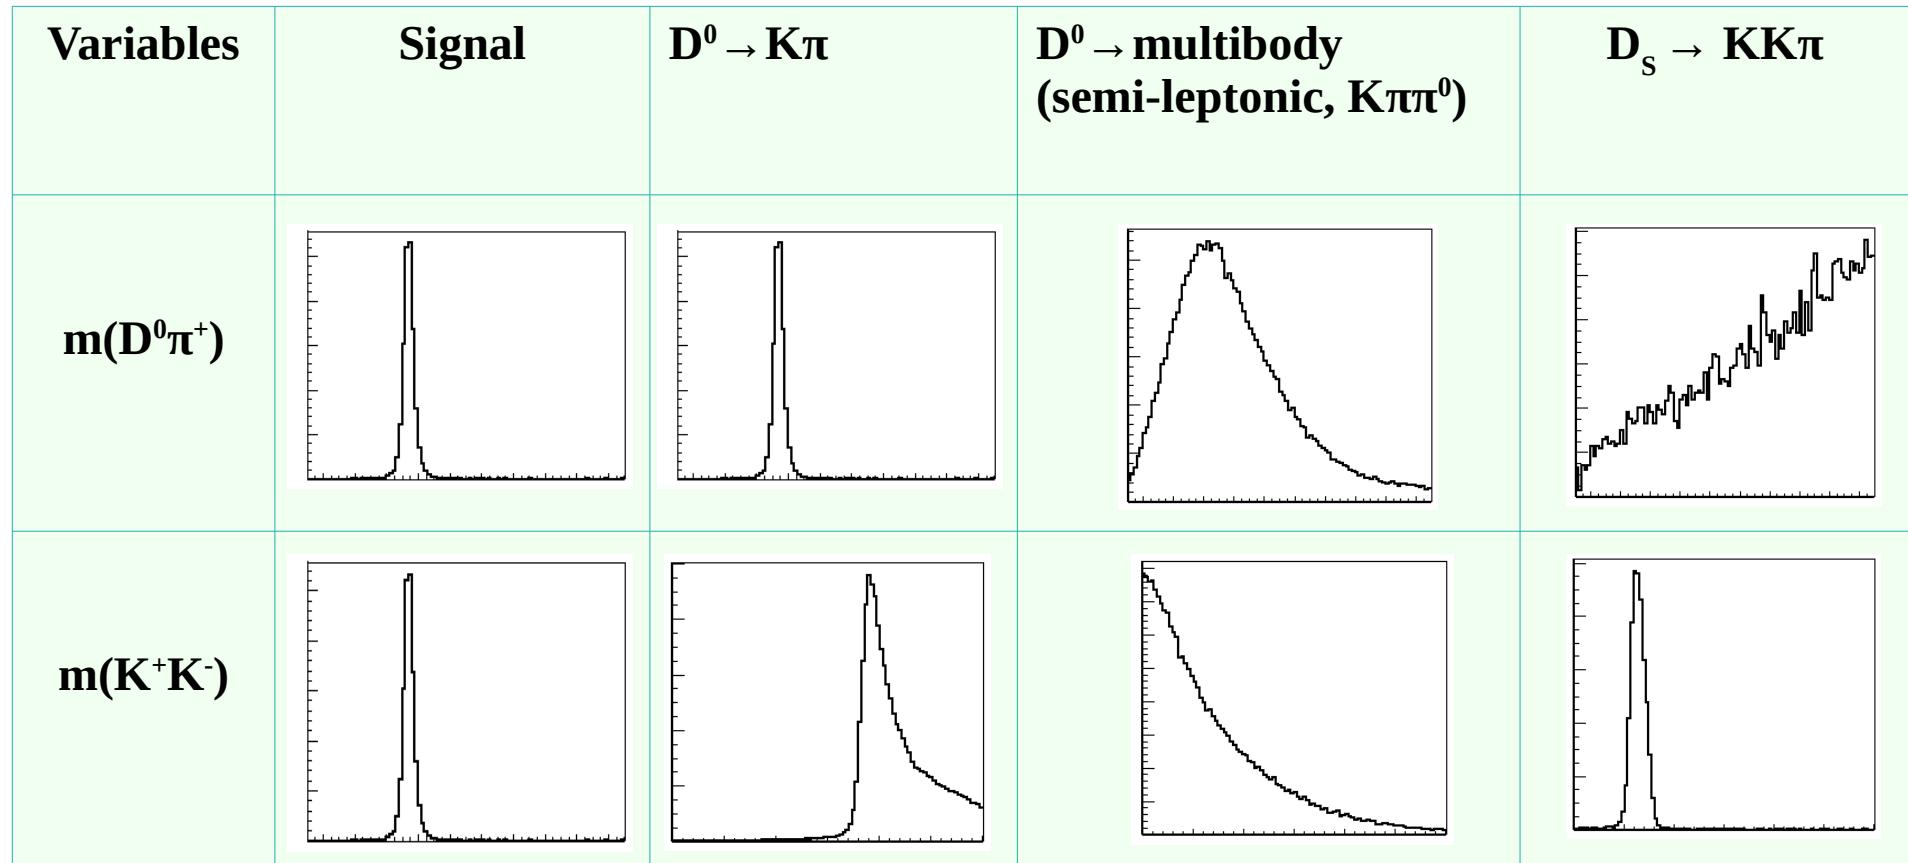

$D^0 \rightarrow K^+K^-$ decay

Selection Criteria

Variable	Criteria
$ d_r (\pi_s^+, K^\pm)$	< 0.5 cm
$ d_z (\pi_s^+, K^\pm)$	< 2 cm (Selection criteria on Impact parameters)
$\theta(\pi_s^+, K^\pm)$ (Belle II only)	$[17, 150]^\circ$
# CDC hits (K^\pm)	> 20
# SVD hits (K^\pm)	> 0
$\mathcal{L}_K / (\mathcal{L}_K + \mathcal{L}_{\pi/e})(K^\pm)$	$0.6/0.1$ → (Identification of charged kaon from pion/electron)
$\Delta m = (m(D^{*+}) - m(D^0))$	$< 0.16 \text{ GeV}/c^2$
$p_{\text{cms}}(D^{*+})$	$> 2.5 \text{ GeV}/c$ → (To reduce the events where D^{*+} coming from B meson)
TreeFitter probability	> 0.001
Best-candidate selection	D^{*+} candidate with largest TreeFitter probability

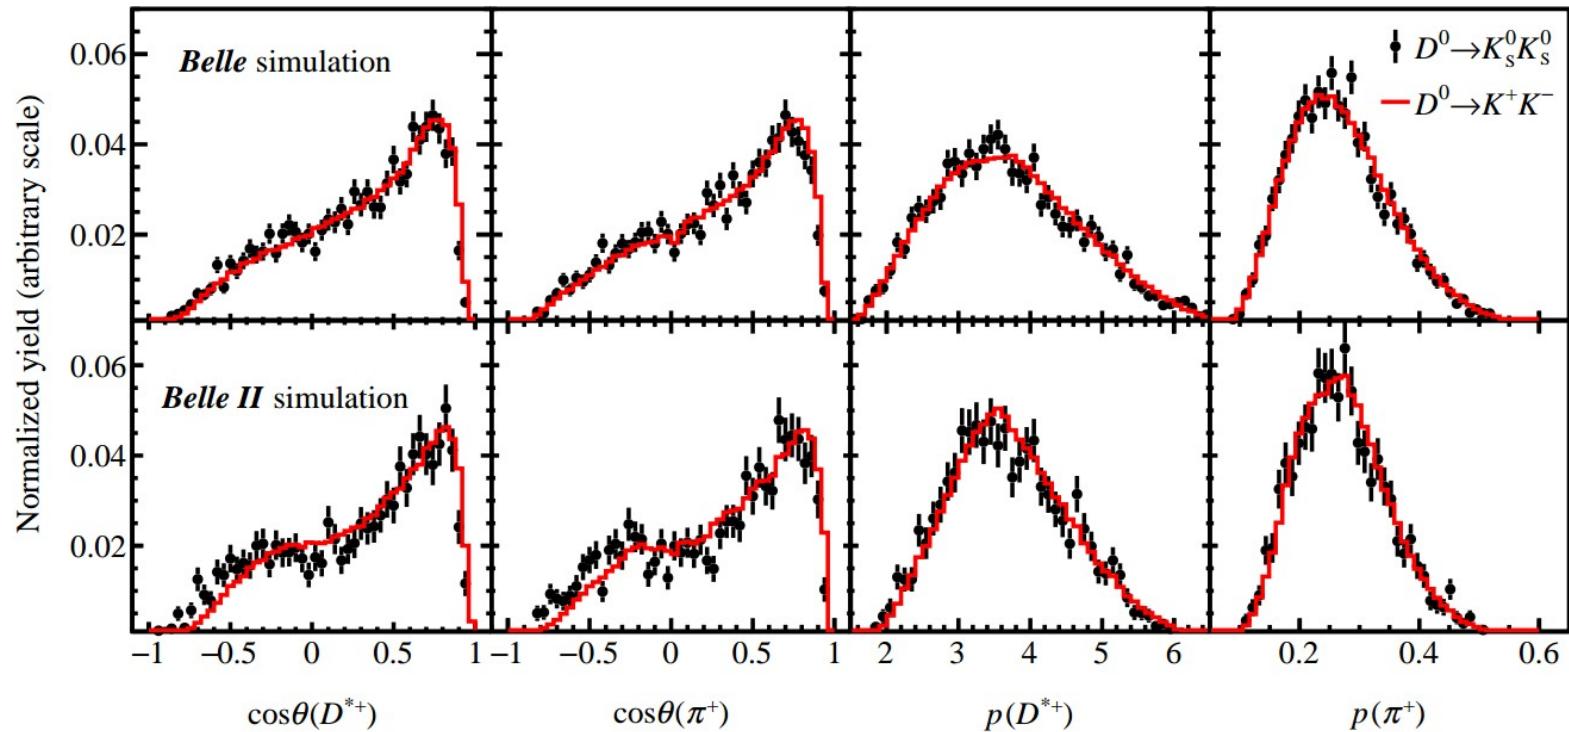

Treefitter is used with IP constraint.

Sample Composition ($D^0 \rightarrow K^+K^-$)

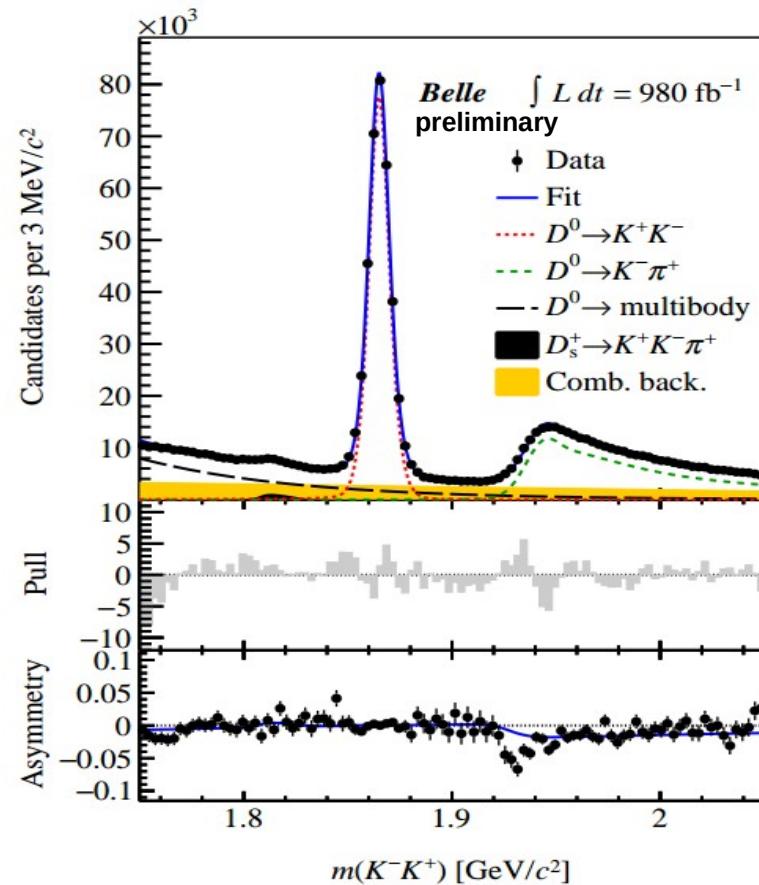

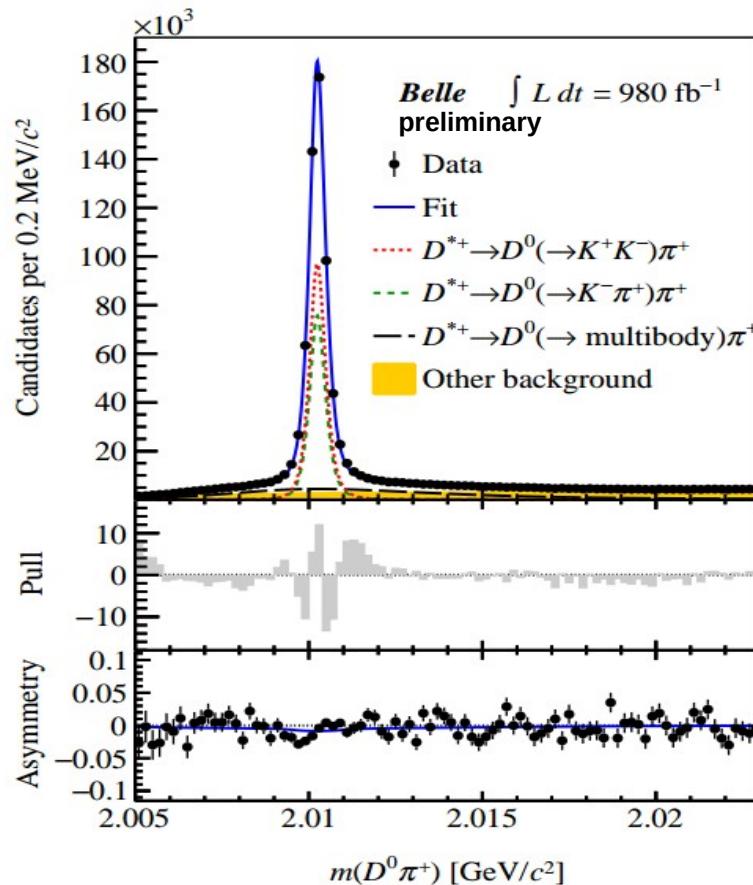

- Asymmetry determined from unbinned fit to $(m(D^0\pi^+), m(K^+K^-))$ distributions of D^0 and \bar{D}^0 candidates.
- Shapes determined from either simulation or sideband data, assumed to be the same for D^0 and \bar{D}^0 decays.

Distributions of momentum and $\cos\theta$ for D^{*+} and π_s

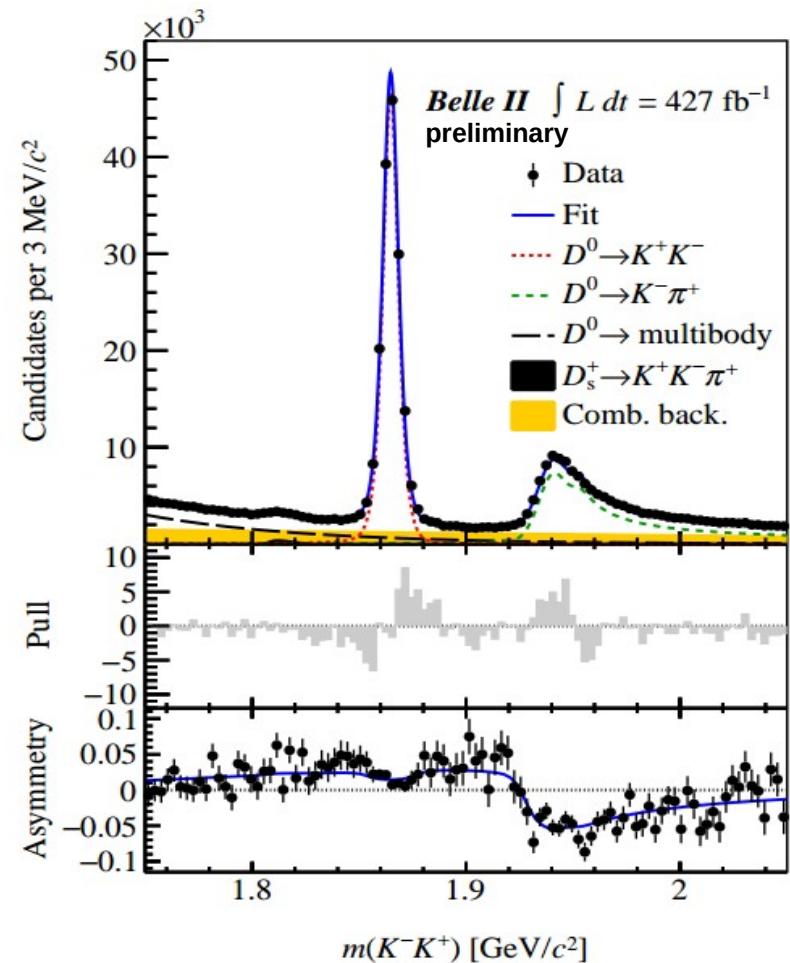

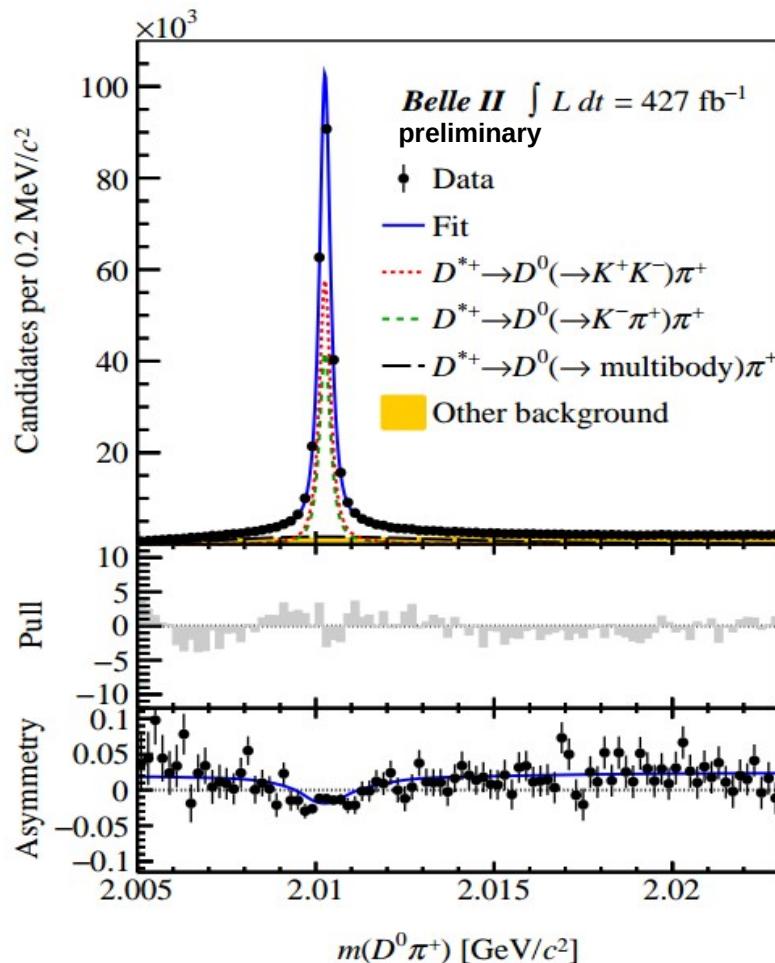

- The kinematic difference between signal and control modes in Belle II.
- Exclusively determined by the PID requirement on the charged kaons in the control mode, which imposes a reduced acceptance in the backward region due to the limited acceptance from the TOP.
- In Belle this effect is essentially absent because the PID requirement and detector acceptance are different (also due to the fact that the boost in the forward direction is larger than in Belle II). 12

Fit projections for $D^0 \rightarrow K^+K^-$ (Belle)

$N(D^0 \rightarrow K^+K^-) = 3,08,760 \pm 570$
 $A_{\text{raw}}(D^0 \rightarrow K^+K^-) = (0.17 \pm 0.19)\%$

Fit projections for $D^0 \rightarrow K^+K^-$ (Belle II)

$N(D^0 \rightarrow K^+K^-) = 1,45,520 \pm 400$
 $A_{\text{raw}}(D^0 \rightarrow K^+K^-) = (1.61 \pm 0.27)\%$

Sources of systematic uncertainties in $A_{CP}(D^0 \rightarrow K_s^+ K_s^-)$

- **PDF shape:**

- Different signal and background models are tried, while the D^0 and \bar{D}^0 shapes are same.
- Same PDFs as that of the default fit model are used, but asymmetries are introduced in the shape parameters.

- **Re-Weighting:**

- Distributions of $\cos\theta$ and momenta for D^{*+} and π_s are not in perfect agreement for the signal and control modes.
- The difference between the weighted and unweighted fits are incorporated as a systematic.

- **$A_{CP}(D^0 \rightarrow K^+ K^-)$:** External input

Source	Uncertainty (%)	
	Belle	Belle II
Modeling in the $D^0 \rightarrow K_s^0 K_s^0$ fit	0.04	0.05
Modeling in the $D^0 \rightarrow K^+ K^-$ fit	0.02	< 0.01
Kinematic equalization	0.06	0.07
Input $A_{CP}(D^0 \rightarrow K^+ K^-)$	0.05	0.05
Total systematic	0.09	0.10
Statistical	1.60	2.30

Results

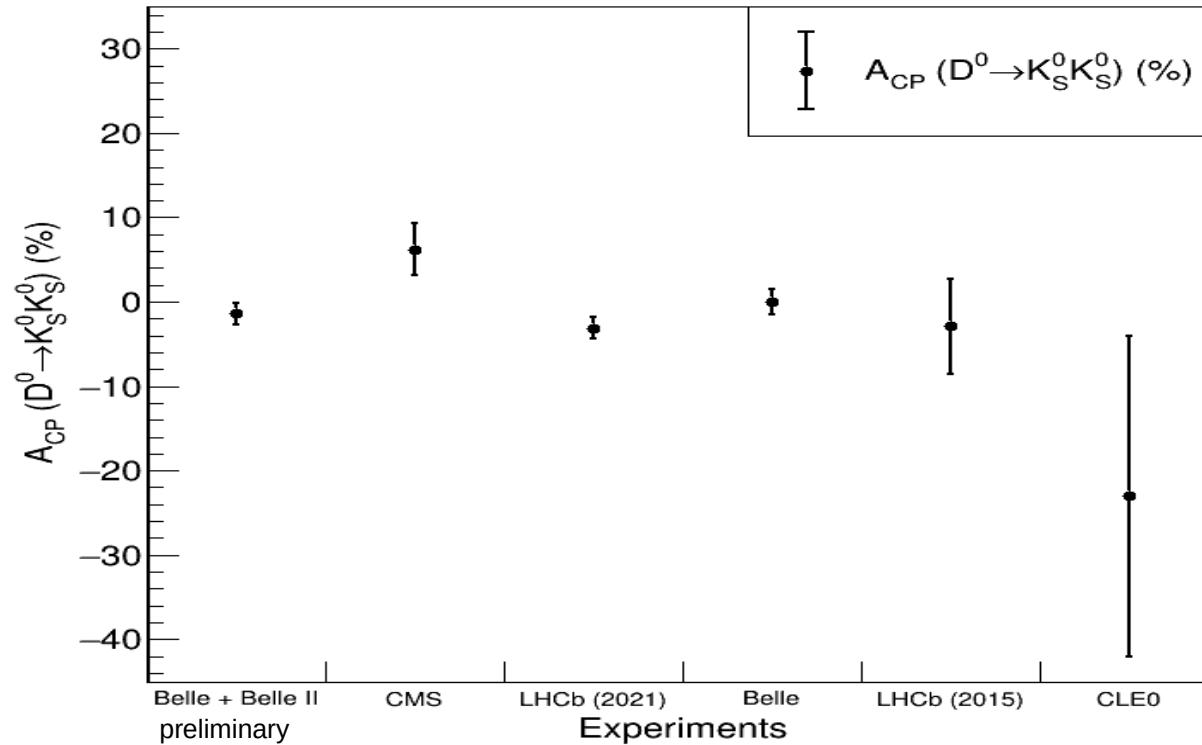

$A_{CP}(D^0 \rightarrow K_s K_s)$ in Belle: $(-1.1 \pm 1.6 \pm 0.1) \%$

$A_{CP}(D^0 \rightarrow K_s K_s)$ in Belle II: $(-2.2 \pm 2.3 \pm 0.1) \%$

$A_{CP}(D^0 \rightarrow K_s K_s)$ (Belle + Belle II) = $(-1.4 \pm 1.3 \pm 0.1) \%$

first uncertainty is statistical
second is systematic.

Comparison of A_{CP} with previous Measurements

The combined results have comparable precision to the world-best measurement from LHCb.

Summary

- Measured the A_{CP} in $D^0 \rightarrow K_s K_s$ with (Belle + Belle II) dataset.

$A_{CP}(D^0 \rightarrow K_s K_s)$ in Belle: $(-1.1 \pm 1.6 \pm 0.1) \%$

$A_{CP}(D^0 \rightarrow K_s K_s)$ in Belle II: $(-2.2 \pm 2.3 \pm 0.1) \%$

$A_{CP}(D^0 \rightarrow K_s K_s)$ (Belle + Belle II) = $(-1.4 \pm 1.3 \pm 0.1) \%$

- It has a factor-two better systematic uncertainty compared to the previous Belle published results, thanks to the usage of the $D^0 \rightarrow K^+ K^-$ control mode, which provides a more precise A_{CP} external input compared to the $D^0 \rightarrow K_s^0 \pi^0$ control mode used in previous study. **Phys. Rev. Lett. 119 (2017) 171801**
- The combined results has comparable precision to the world-best measurement from LHCb.

Thank you very much for your kind Attention
