Received 9 March 1998; accepted 29 April 1998

The goal

1. Search for „new physics“
(rare events in a large amount of data)

Case A: *we know what we want*

tetraquarks, magnetic monopoles, antideuterons, ...

Case B: *we don't know what we want*

„free“ running search for anomalies

2. unsupervised

3. in realtime in hardware (e.g. FPGA)
