
ACTS

status update – experience at Belle II

5 June 2020
Area-D Meeting

Ralf Farkas
ralf@uni-bonn.de

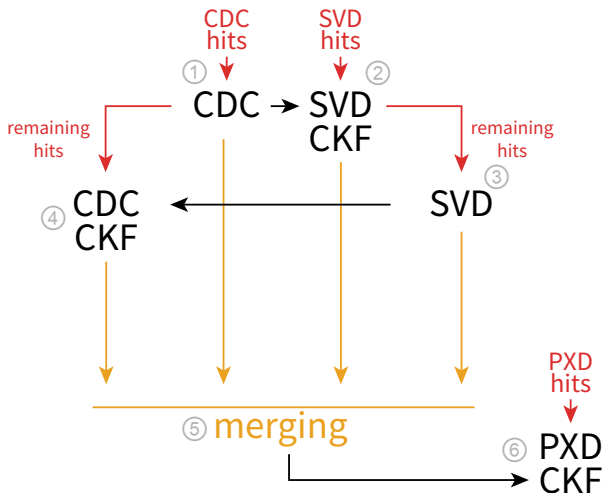

Part 1

Belle II

Belle II Tracking – modular approach

Part 2

Belle II Geometry in ACTS

PXD + SVD — propagation

PXD + SVD — track reconstruction

- slanted parts: merged into ACTS!
 - #200 ‘Introducing ConeVolumeBounds’ ↻
- ✓ load PXD from Belle II TGeo geometry
- ✓ use `PhotonCollision:gmgm2bbbar=on` (don't tell anyone)
- ✓ particles produced, but ...

problem: digitization

- digitization step *should* write out hit and truth info
 - non-functional for TGeo-based detectors ☹
- write out hits directly after simulation

Part 3

ACTS workshop

ACTS workshop – takeaways

- deeper insight into TGeo parsing (PANDA, slanted Belle II parts, ...)
- deprecate TrackingGeometry infrastructure (#13 ↻, #165 ↻, #185 ↻)
 - replace layers with volumes → volumes inside volumes, ...
 - TPC/CDC
 - simplified navigator

Part 4

summary

summary

- ACTS workshop: loads of geometry...
- currently working on reco in Belle II silicon
- CDC: (future) major changes in ACTS

next steps

- Belle II tracking chain w/ ACTS
 - basf2 / ACTS?
