

# Hands-on: b2bii

Frank Meier

Belle II Summer Workshop  
12 – 16 July 2021

# Introduction

- ▶ B2BII converts Belle dataobjects into Belle II dataobjects ([Comput. Softw. Big Sci. 2 \(2018\)](#))
  - ▶ `convertBelleMdstToBelleIIMdst`
- ▶ special particle lists for neutrals
  - ▶ `gamma:mdst`, `pi0:mdst`, `K_S0:mdst`, `Lambda0:mdst`, `gamma:v0mdst` (converted photons),  
`K_L0:mdst`
- ▶ dedicated PID variables
  - ▶ `atcPIDBelle()`, `eIDBelle`, `muIDBelle`, `muIDBelleQuality`
- ▶ “standard cuts” for  $K_S^0$  and  $\Lambda$ : `goodBelleKshort` and `goodBelleLambda`
- ▶ in previous releases switches were necessary in many functions (`buildRestOfEvent`, `flavorTagger`) but in latest releases this is handled automatically behind the scenes
- ▶ latest FEI training (`FEI_B2BII_light-2012-minos`) and B2BII flavor tagging payloads only available in analysis global tag
  - ▶ only if those are needed, disable kekcc-based B2BII database by setting `enableLocalDB=False` in `convertBelleMdstToBelleIIMdst`

## Hands-on I: Generate Belle MC

- ▶ log into kekcc
- ▶ create a new directory or go to your directory of the basf2 hands-on session from Monday
- ▶ copy Belle MC generation helper scripts: `cp -r ~fmeier/BelleIISummerSchool2021/BelleMC .`
- ▶ load Belle software settings: `source /sw/belle/local/etc/bashrc_general`
- ▶ change into evtgen directory: `cd BelleMC/evtgen`
- ▶ copy decfile for  $B^\pm \rightarrow DK^\pm$ : `cp ~fmeier/BelleIISummerSchool2021/Bu2DK_D2KSpi0.dec .`
- ▶ generate 10 000 events for experiment 65 split into 20 jobs of 500 events
  - ▶ nBB-limited is prepared to have only experiment 65
  - ▶ Y4S.conf is evtgen config file for  $\Upsilon(4S)$ productions
- ▶ check that .gen files are produced in gen/ directory and inspect one event using `bbsview filename.gen` (load three times, then print GEN\_HEPEVT)
- ▶ simulate detector response:  
`./runGsimReco.csh <your-directory>/BelleMC/evtgen/gen/Bu2DK_D2KSpi0/` from gsim/ directory

## Hands-on II: Conversion of steering file

- ▶ start from script created on Monday or copy my latest version  
`cp ~fmeier/BelleIISummerSchool2021/improvedBu2DKReconstruction.py .`
- ▶ remember to start a new `kekcc` session with the Belle II tools loaded and `light-2106-rhea` set up
- ▶ load merged  $K_S^0$  and all  $\pi^0$  particle lists (`stdV0s` and `stdPi0s`)
- ▶ replace  $D^0$  daughters  $K^+$  and  $\pi^-$  with `K_S0:merged` and `pi0:all`
- ▶ update decay string in variable alias creation functions
- ▶ add mass constraints for  $K_S^0$  and  $\pi^0$  to vertex fit

You should have a working **Belle II** steering file for the reconstruction of  $B^\pm \rightarrow DK^\pm$  with  $D^0 \rightarrow K_S^0\pi^0$  now.

- ▶ replace  $K_S^0$  and  $\pi^0$  particle lists with pre-defined B2BII versions (label `:mdst`)
- ▶ load generated Belle MC files with `convertBelleMdstToBelleIIMdst`

You should have a working **B2BII** steering file for the reconstruction of  $B^\pm \rightarrow DK^\pm$  with  $D^0 \rightarrow K_S^0\pi^0$  now.
