

# DISCUSSION ON PLAN FOR FALL RUN

S. Yamada (KEK)

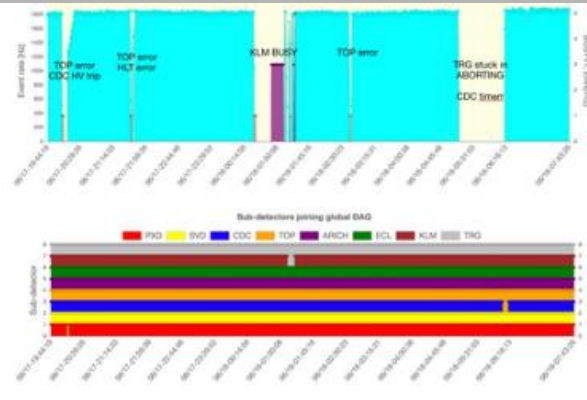

# DISCUSSION AT TUESDAY SESSION

Not so concrete plan in the autumn run

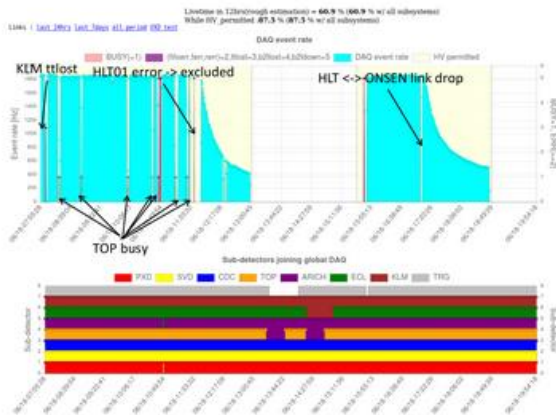

# Continue feedbacks about downtime like during phase 3

[https://b2rc.kek.jp/channel/daq\\_commissioning\\_status](https://b2rc.kek.jp/channel/daq_commissioning_status)

- DAQ expert shifters report the downtime and reason.
- Those plots has been useful to explain the current status.

# MORE DETAILED INFORMATION

- The previous plots are not enough to know which part needs to be fixed/improved soon.
- It is better to have more detailed information
  - But currently it takes hours to make summary tables in a week like below...
  - Considering what is an easy way to do this kind of thing.

Ranking of downtime this week

1. sub-system A : 10hrs
2. sub-system B : 3hrs
3. Sub-system C : 10min.
4. ...

date	Downtime (min.)	Error( Sometimes, occurred due to other sub-system's trouble)
06/18-01:24:13	55.7	Cpr7001 froze
06/21-04:26:37	45.9	SLC daemon died on SVD ROPC
6/21-08:25:52	18.8	SLC daemon died on TOP COPPER
06/18-11:47:04	15.0	HLT error
06/21-19:08:25	13.5	HLT stuck
	12.8	Other minor troubles x3
	<b>161.7</b>	

# When errors occur, currently we check;

(L. Fujioka)

- 1, log message from DAQ processes
- 2, output of statftf
- 3, status indicator of SLC system

->

Diagnose these info. and provide shifters what to do.

## Notice :

- CR shifters will not check many outputs -> must be only one output
- The main purpose of the system is to ask CR shifters to do something -> The output needs to include what to do.

## Towards auto-restart

### ● **ttctrld**

- should send something to master RC, but `RCCommand::STOP` is not the right one. Probably need to add `RCCommand::ERROR` or something?

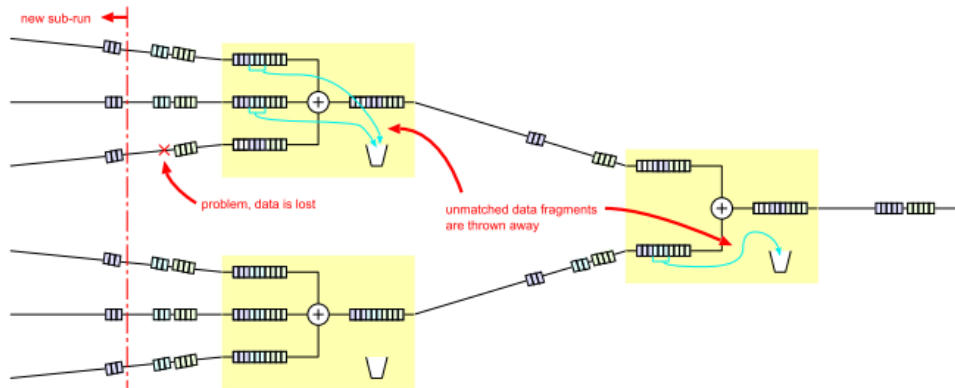

### ● **runcontrold**

- it is a very passive process, and probably not a place to add many conditions such as infinite loop check
- still some locking mechanism is needed in runcontrold

### ● **another app?**

- Probably we need a process to check status of many things and tell master runcontrold what to do next (i.e., replacement of CSS GUI)
- Who is in charge?

## EB recovery

#1	#2	#3	EB		
Run 638 sub-run 0 - run reset					
0	0	0	0	0	0
1	1	1	1	1	1
2	2	2	2	2	2
3	3	3	3	3	3
4	4	4	4	4	4
5	x	5	(throw away)		
6	x	6	:		
7	x	7	:		
Run 638 sub-run 1 - sub-run reset					
8	8	8	8	8	8
9	9	9	9	9	9
10	10	10	10	10	10
:	:	:	:	:	:
:	:	:	:	:	:
9700	9700	9700	9700	9700	9700
9850	9850	(lost)	(throw away)		
10000	(lost)	(lost)	:		
Run 638 sub-run 0 - run reset					
0	0	0	0	0	0
1	1	1	1	1	1
2	2	2	2	2	2
3	3	3	3	3	3

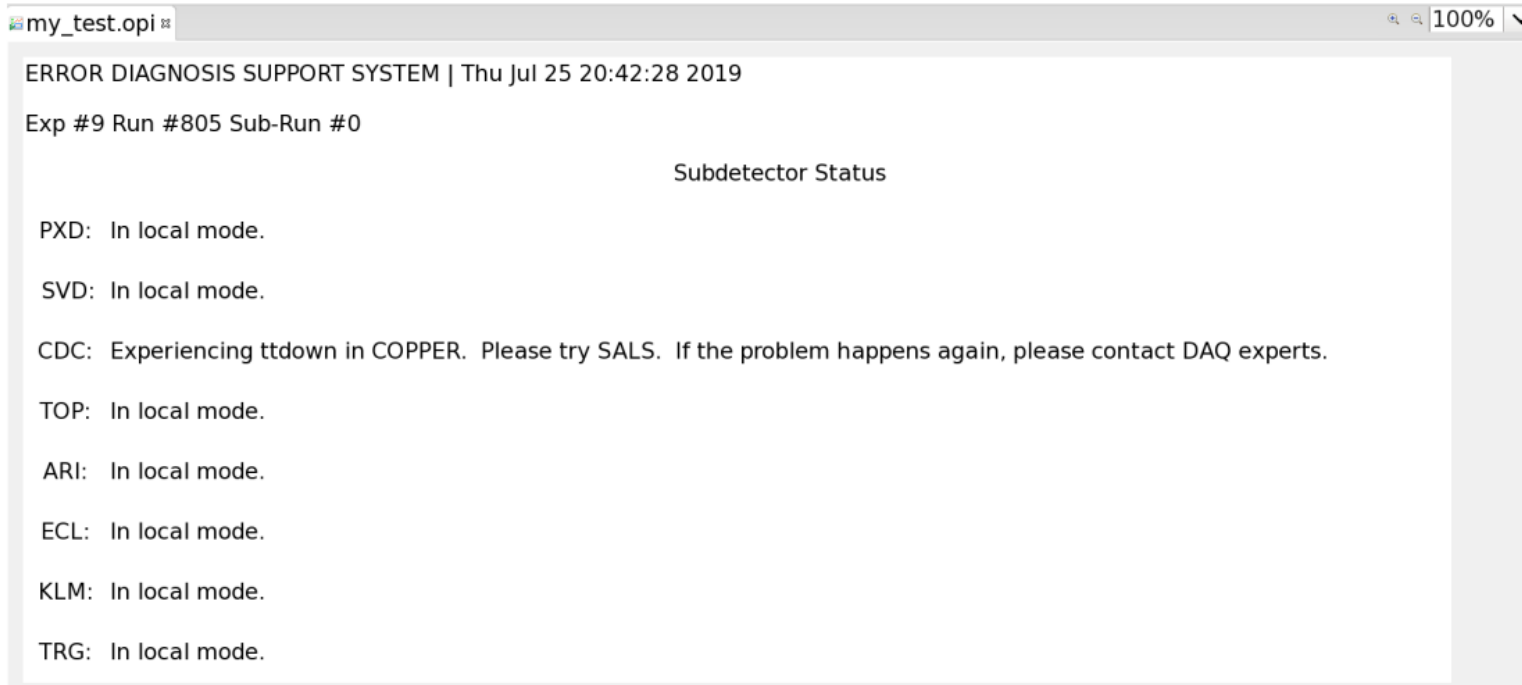

### ● Data-driven recovery of EB buffers

- Data flow is blocked by a failure at one point
- By finding new "sub-run" event fragment, read out data from the previous sub-run will be simply discarded

### ● events are realigned at EB

- Done by throwing away events from previous (sub)run at EB input

## Message to CR shifter in this example

```
my_test.opi 100%
ERROR DIAGNOSIS SUPPORT SYSTEM | Thu Jul 25 20:42:28 2019
Exp #9 Run #805 Sub-Run #0

Subdetector Status

PXD: In local mode.
SVD: In local mode.
CDC: Experiencing ttdown in COPPER. Please try SALS. If the problem happens again, please contact DAQ experts.
TOP: In local mode.
ARI: In local mode.
ECL: In local mode.
KLM: In local mode.
TRG: In local mode.
```

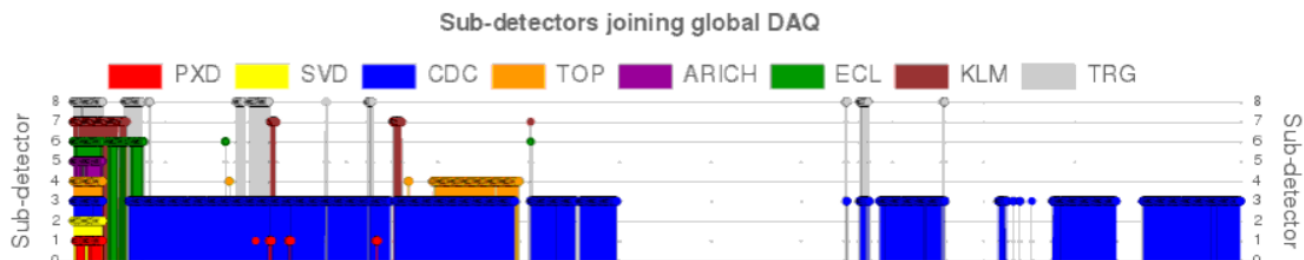

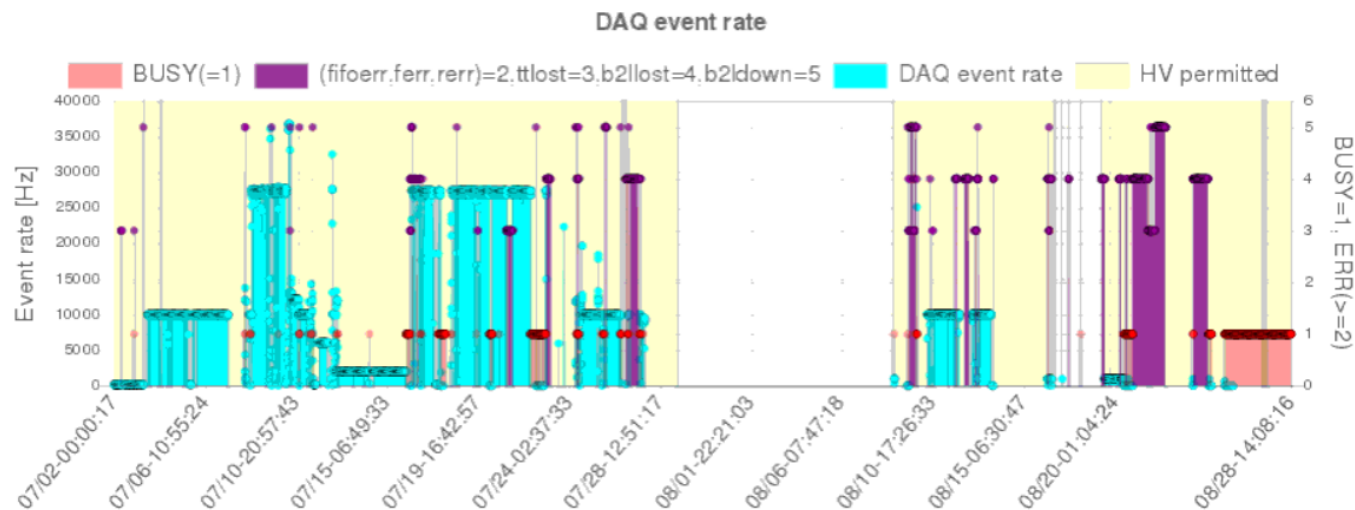

Still, it will answer “I don’t know” for the majority of troubles.

# DAQ operation schedule

# Global DAQ status during this summer shutdown

Livetime in the whold period(rough estimation) = **38.4 %** (**1.7 %** w/ all subsystems)

While HV\_permitted : **49.6 %** (**2.2 %** w/ all subsystems)

RCControlMain.opi 11 RC CDC
