

The software group & basf2 & other stuffs

Giacomo De Pietro, giacomo.pietro@kit.edu

Belle II Germany Meeting, 19-21/09/2022 @ Munich

Outline

- Status of the software group
- Validation
- Current and future release(s)
- Collaborative tools

注意！

- What follows is my view about what we should aim at as software group!
 - Not “the group says we must do this”, but “I think we should do this”

What does “the software group” do?

- Developing, validating and deploying basf2
 - Including tools, externals and related stuffs
- Organizing the starter kits and providing documentation
- Cooperating with the other groups (including subdetectors)
- “Maintaining” some collaborative tools
- Using, whenever necessary, funny pictures of cute animals

The software group

- Compared to some years ago, the SW group is much smaller
 - Of course, less development is required, but we are losing expertise in key areas...

The Belle II Core Software

Belle II Framework Software Group

T. Kuhr¹  · C. Pulvermacher² · M. Ritter¹ · T. Hauth³ · N. Braun³

- 4/5 authors of the basf2 paper left the collaboration...
- It's hard that students nowadays use ROOT or C++ for their analyses...
 - I am a bit pessimistic about the future...

On Personpower

10 TYPES
OF PEOPLE
IN THIS WORLD
THOSE WHO UNDERSTAND
BINARY
AND THOSE WHO DON'T

→ Tracking meetings are attended by several (> 20) people: detector experts, calibration experts, performance-studies people, **very few developers**

→ when an issue is reported, most of the time we do find volunteers to look at that into more details, from the analysis viewpoint (based on mDST), ...

- we do appreciate the feedbacks from analysts that discover some tracking “feature” during their studies, and their availability to look into the problem in more details

→ ... but, when then work should move from the analyst’s to the developer’s side of the wall, at this point we have a personpower problem

- experts of that part of code most probably are gone, the other developers are overcommitted

→ Tracking still needs a good balance of experts, developers and performance-studies people, **we are out-of-balance right now**

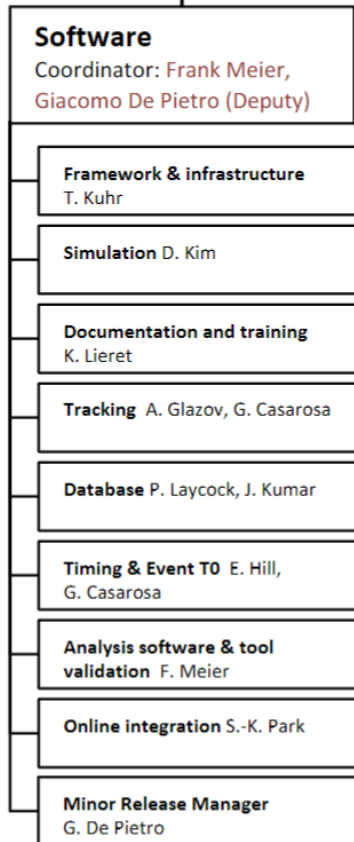

aller
xpertise in key

analyses...

- I am a bit pessimistic about the future...
- ... and I am not the only one

*From Giulia,
January 2022 B2GM*

The software group chart

- Yes, the chart should be updated...
 - Timing: E. Hill → M. Staric
 - Analysis: F. Meier → Y. Sato
 - Documentation: K. Lieret → ...
- Flaming needs:
 - New convenors for the Timing and Event T0 group
 - Both Giulia and Marko would like to step down 🔥
 - A new convenor for the Documentation and training group
 - Kilian left the collaboration :(🔥🔥🔥
 - Note: we already contacted few persons, but we received only “no”s

The software group and the other Belle II groups

- In general, we have a good connection with the other groups, but in some cases we should make it stronger
 - We need a stronger communication with the computing group: a regular (every a couple of months?) joint meeting may be very useful
- Sometimes, we receive feedbacks in weird ways, especially from the physics WGs...
 - Or WGs do weird assumptions / take weird decisions: don't be afraid, SW folks are your friend, please contact us directly!
 - How? Attend the SW meeting, write us via e-mail, write us via RocketChat, ask something on b2question, etc.

The software group and the HEP community

- We (me and Frank) are in touch with the ROOT developers and we attend the regular meeting with the other large HEP collaborations
- Some Belle II members are convenors of some HEP Software Foundation WGs
- We are closely in touch with the developers of the main generators we use
- AFAIK, no one from Belle II is part of the Geant4 collaboration
 - And we have a serious lack of Geant4 experts (or even Geant4 users)...

Validation (I)

- We should revisit how we validate our software
 - We should catch the issues before deploying them to the collaboration :D
- In theory, the developers should validate their work when developing a new feature / fixing an issue
- In theory, the librarians should properly review the developers work and ask for a validation report
- In practice, this happens quite rarely
 - And most of the times, only the “physics outcome” is checked, neglecting the mDSTs size, the execution time or the memory consumption
 - And since we use basf2 for taking data and for running grid jobs, we can't afford this!

Validation (II)

- What can we do for improving the situation?
 - Increase the awareness of the developers
 - Increase the awareness of the librarians
 - Increase the awareness of the SW shifters
- Is it enough? No!
 - We should seriously reconsider what we run / validate during the nightly build
 - Carefully review both the shifters and the experts plots
 - Produce only “central samples” with common settings / globaltags
 - Avoid that each package, or even each script, produces its own samples!
 - Run the validation on collisions data too
 - We will likely need a dedicated workshop for this
 - And a dedicated team too!

release-07

- In July we tagged prerelease-07-00-00a
 - New externals
 - v01-11-00 in prerelease-07-00-00a, v01-11-01 in HEAD of release/07-00
 - New tracking refinement step for reducing the track charge asymmetry
 - Improved TOP reconstruction
 - Improved ECL likelihoods
- After more than two months, we are still waiting for most of the validation reports
 - We got the validation samples quite late
 - First reports we received (especially about PID) are quite contradictory...
- It's mandatory finishing the validation soon in order to move forward!

release-08

- release-08 will be the first post-LS1 basf2 release
- Our wishlist:
 - Upgrade Geant4 from v10.6 to v11.1
 - Reduce the memory usage
 - Reduce the mDSTs size
 - Get rid of deprecated ROOT classes
 - Improve some of the analysis software tools like FEI and flavor tagger
 - Can we automatize / streamline the training?
 - Reduce further the track charge asymmetry
- Some of these tasks are unassigned (e.g. the mDSTs size reduction):
you are free to contribute and give some help!

Collaborative tools

- During the LS1, we will migrate from Atlassian to GitLab
 - <https://gitlab.desy.de/> (please sign in and create an account!)
 - Bye bye Stash, Jira and Bamboo
 - Unfortunately, we will keep Confluence for a while...
 - But this should not prevent the collaboration from using Confluence **correctly**
- Preparation work for the migration is ongoing
 - Migration of the repositories and the JIRA issues will be automatized
 - See <https://gitlab.desy.de/belle2/test-group/migtst2/-/issues> for the migrated issues ;)
 - Translation of the basf2 pipeline from Bamboo to GitLab is ongoing
 - Our current GitLab runner is “slower” than our current Bamboo agent
 - Because of some fundamental differences between GitLab and Bamboo, we must redesign part of our workflow in order to limit the build time

Conclusions

- We need a new convenor for the Documentation and training group
- Lack of manpower may be an issue in the next few years
- We should revisit how we validate basf2 while developing new features
- release-07 will be out soon
- Bye bye Atlassian! Welcome GitLab!

Conclusions

- We need a new convenor for the Documentation and training group
- Lack of manpower may be an issue in the next few years
- We should revisit how we validate basf2 while developing new features
- release-07 will be out soon
- Bye bye Atlassian! Welcome GitLab!
- Goats!
