HELMHOLTZ RESEARCH FOR
GRAND CHALLENGES

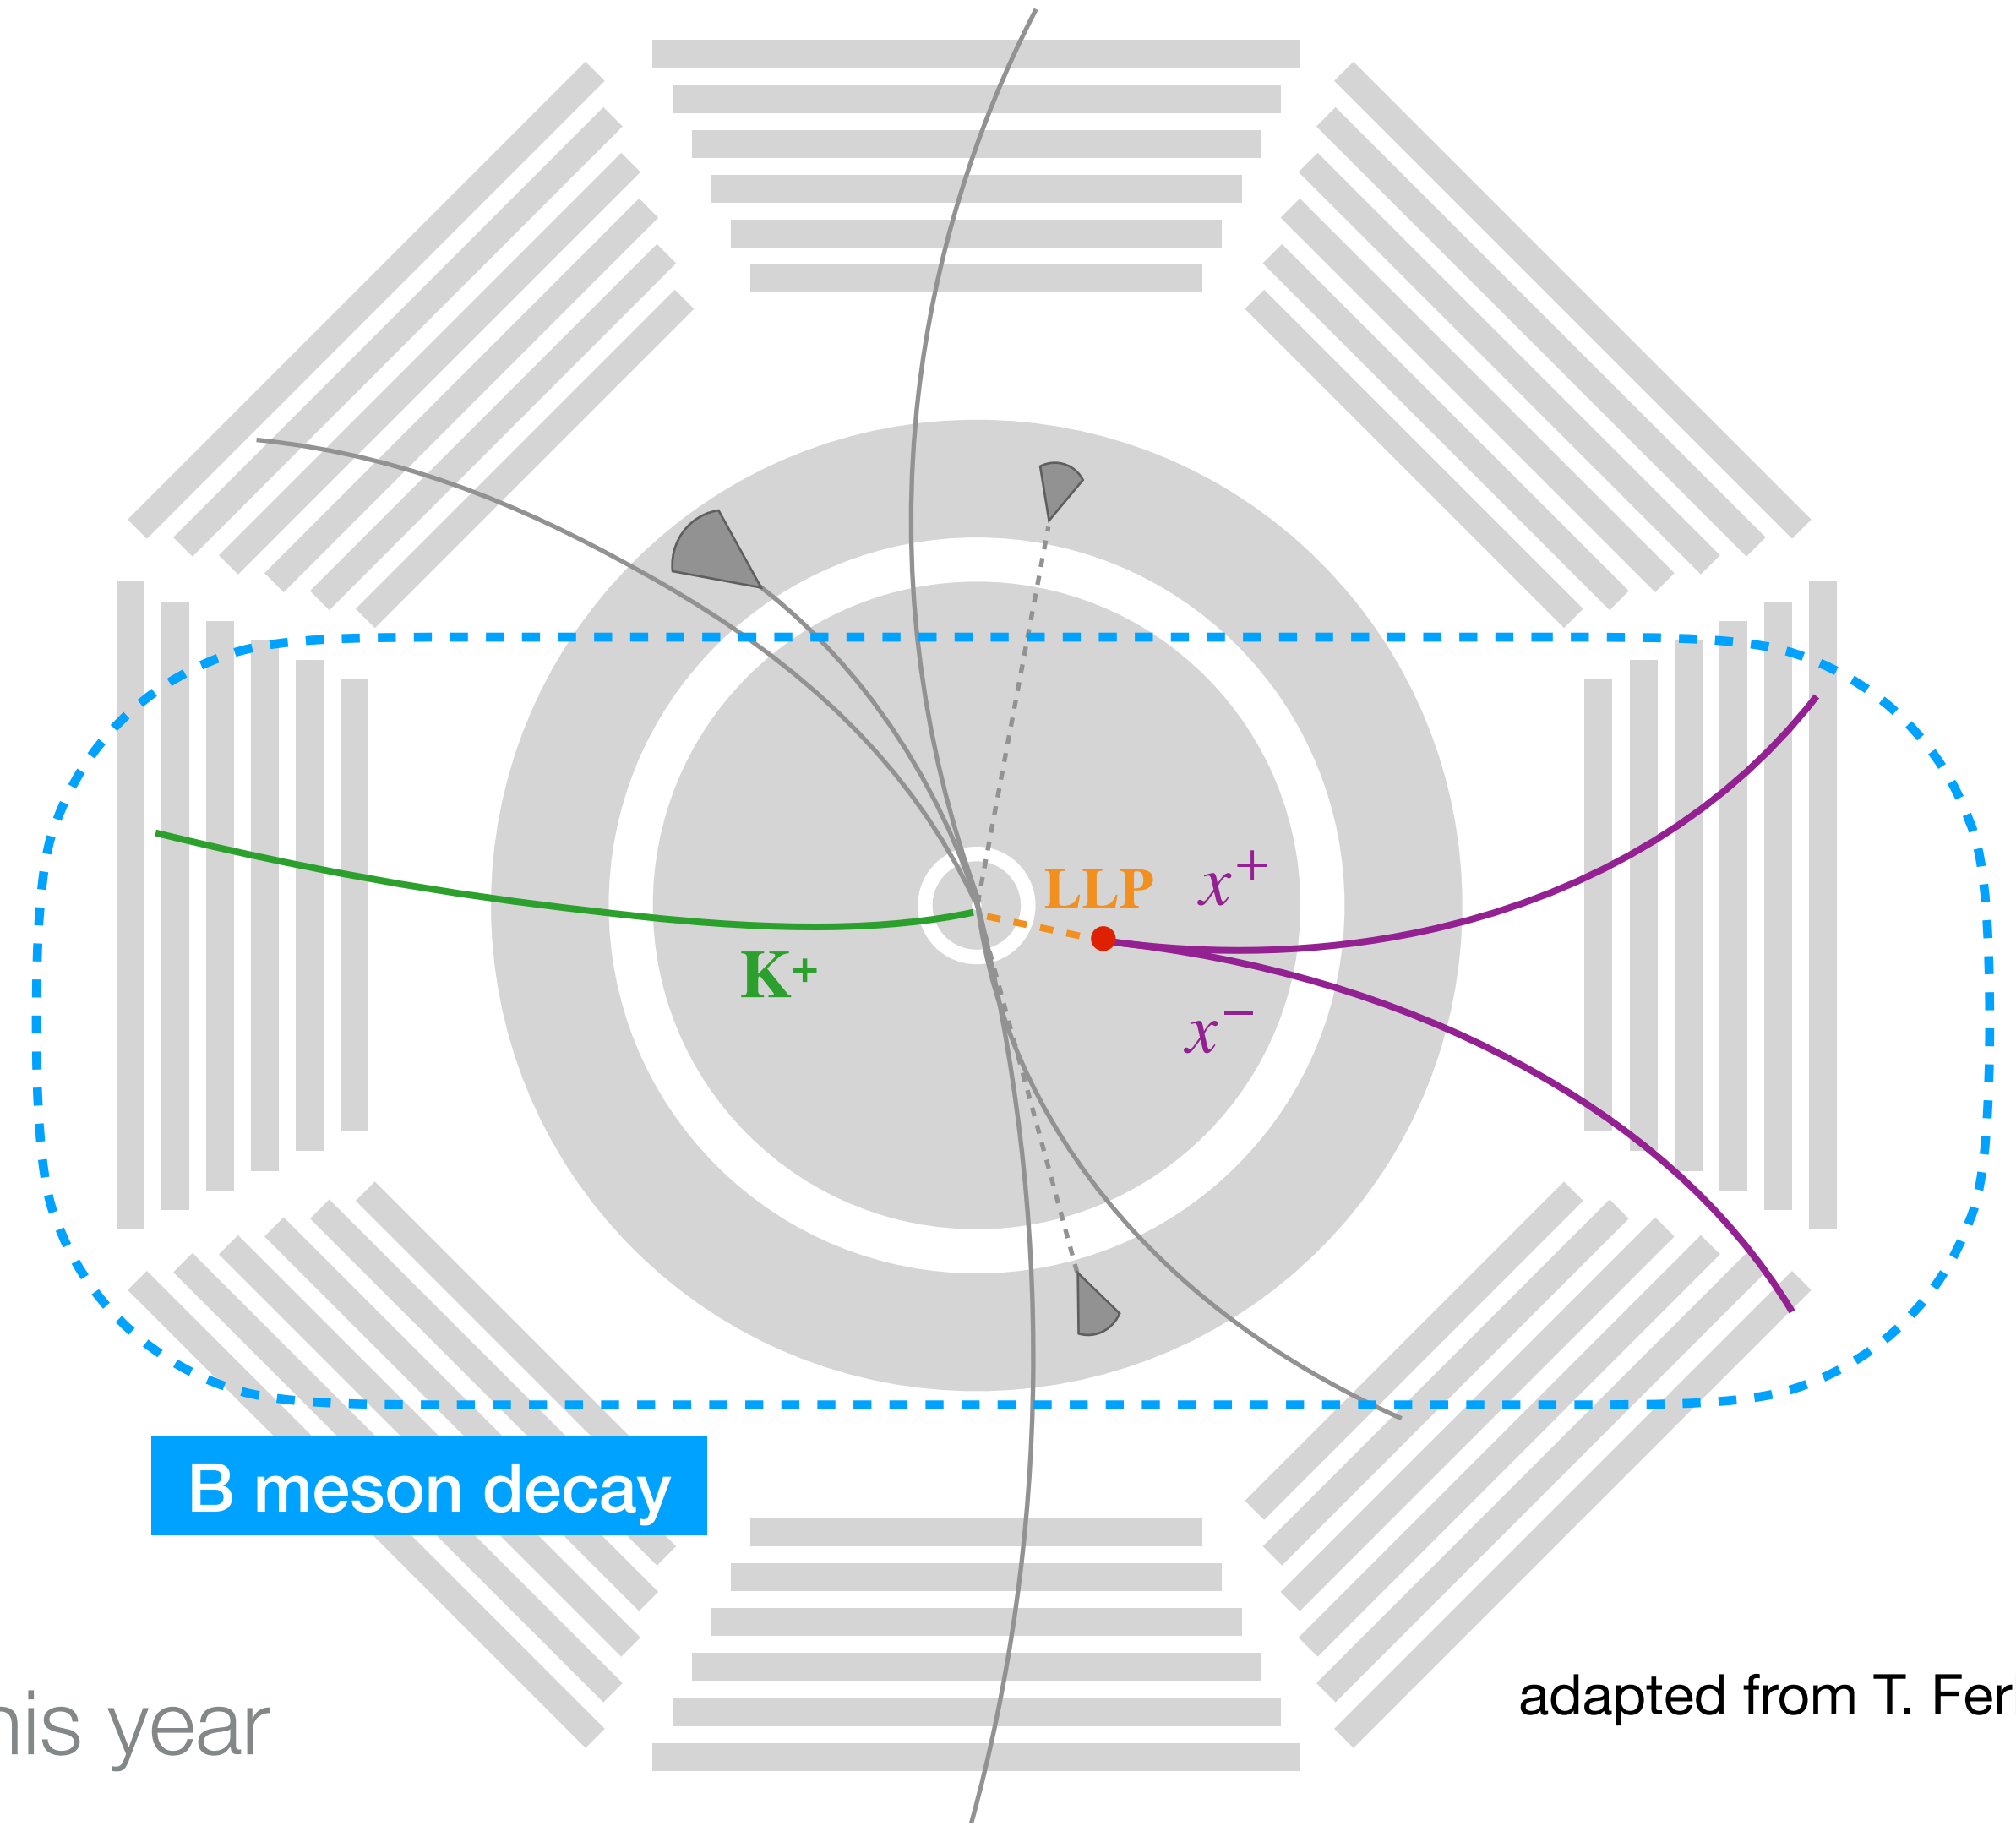

A long-lived (scalar) particle in $b \rightarrow s$.

Phys. Rev. D 101, 095006 (2020)

A long-lived (scalar) particle in $b \rightarrow s$.

- Exclusive search in eight channels:
 - $B^+ \rightarrow K^+ \text{ LLP}$
 - $B^0 \rightarrow [K^{*0} \rightarrow K^+ \pi^-] \text{ LLP}$
 - $\text{LLP} \rightarrow x^+ x^-$ with $x \in (e, \mu, \pi, K)$
- Reconstruct signal B meson
- Bump hunt in rec. LLP mass distribution
- Separately for different LLP lifetime hypotheses
- Aim at publication with Moriond 22 data end of this year (189 fb^{-1} , proc12 + buckets 16-25)

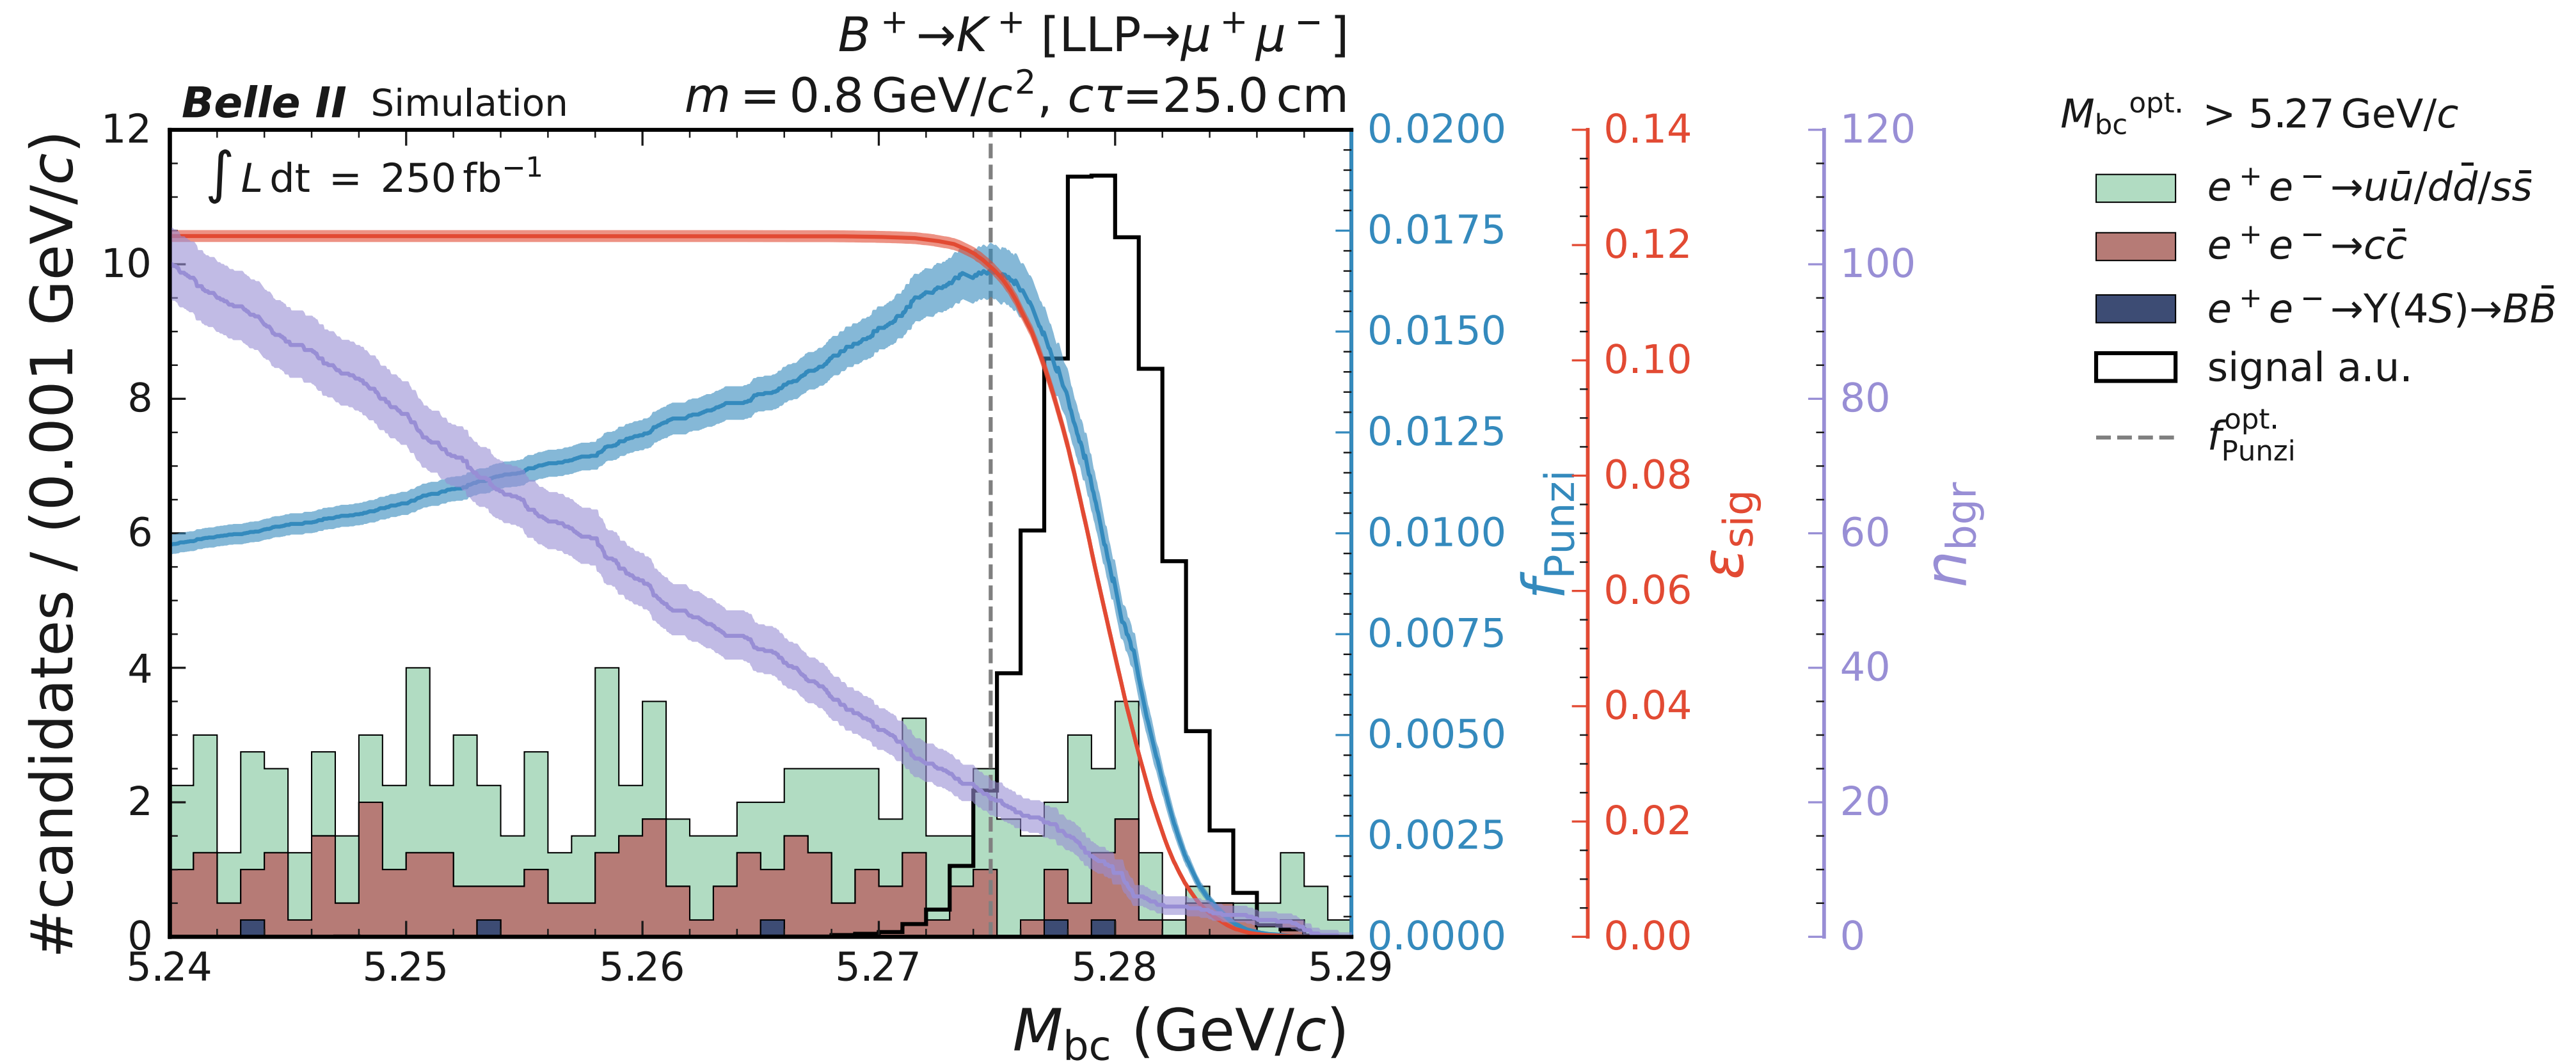

adapted from T. Ferber

Background sources:

- K_S^0
- Combinatorics in $e^+e^- \rightarrow q\bar{q}$
- Peaking B decays

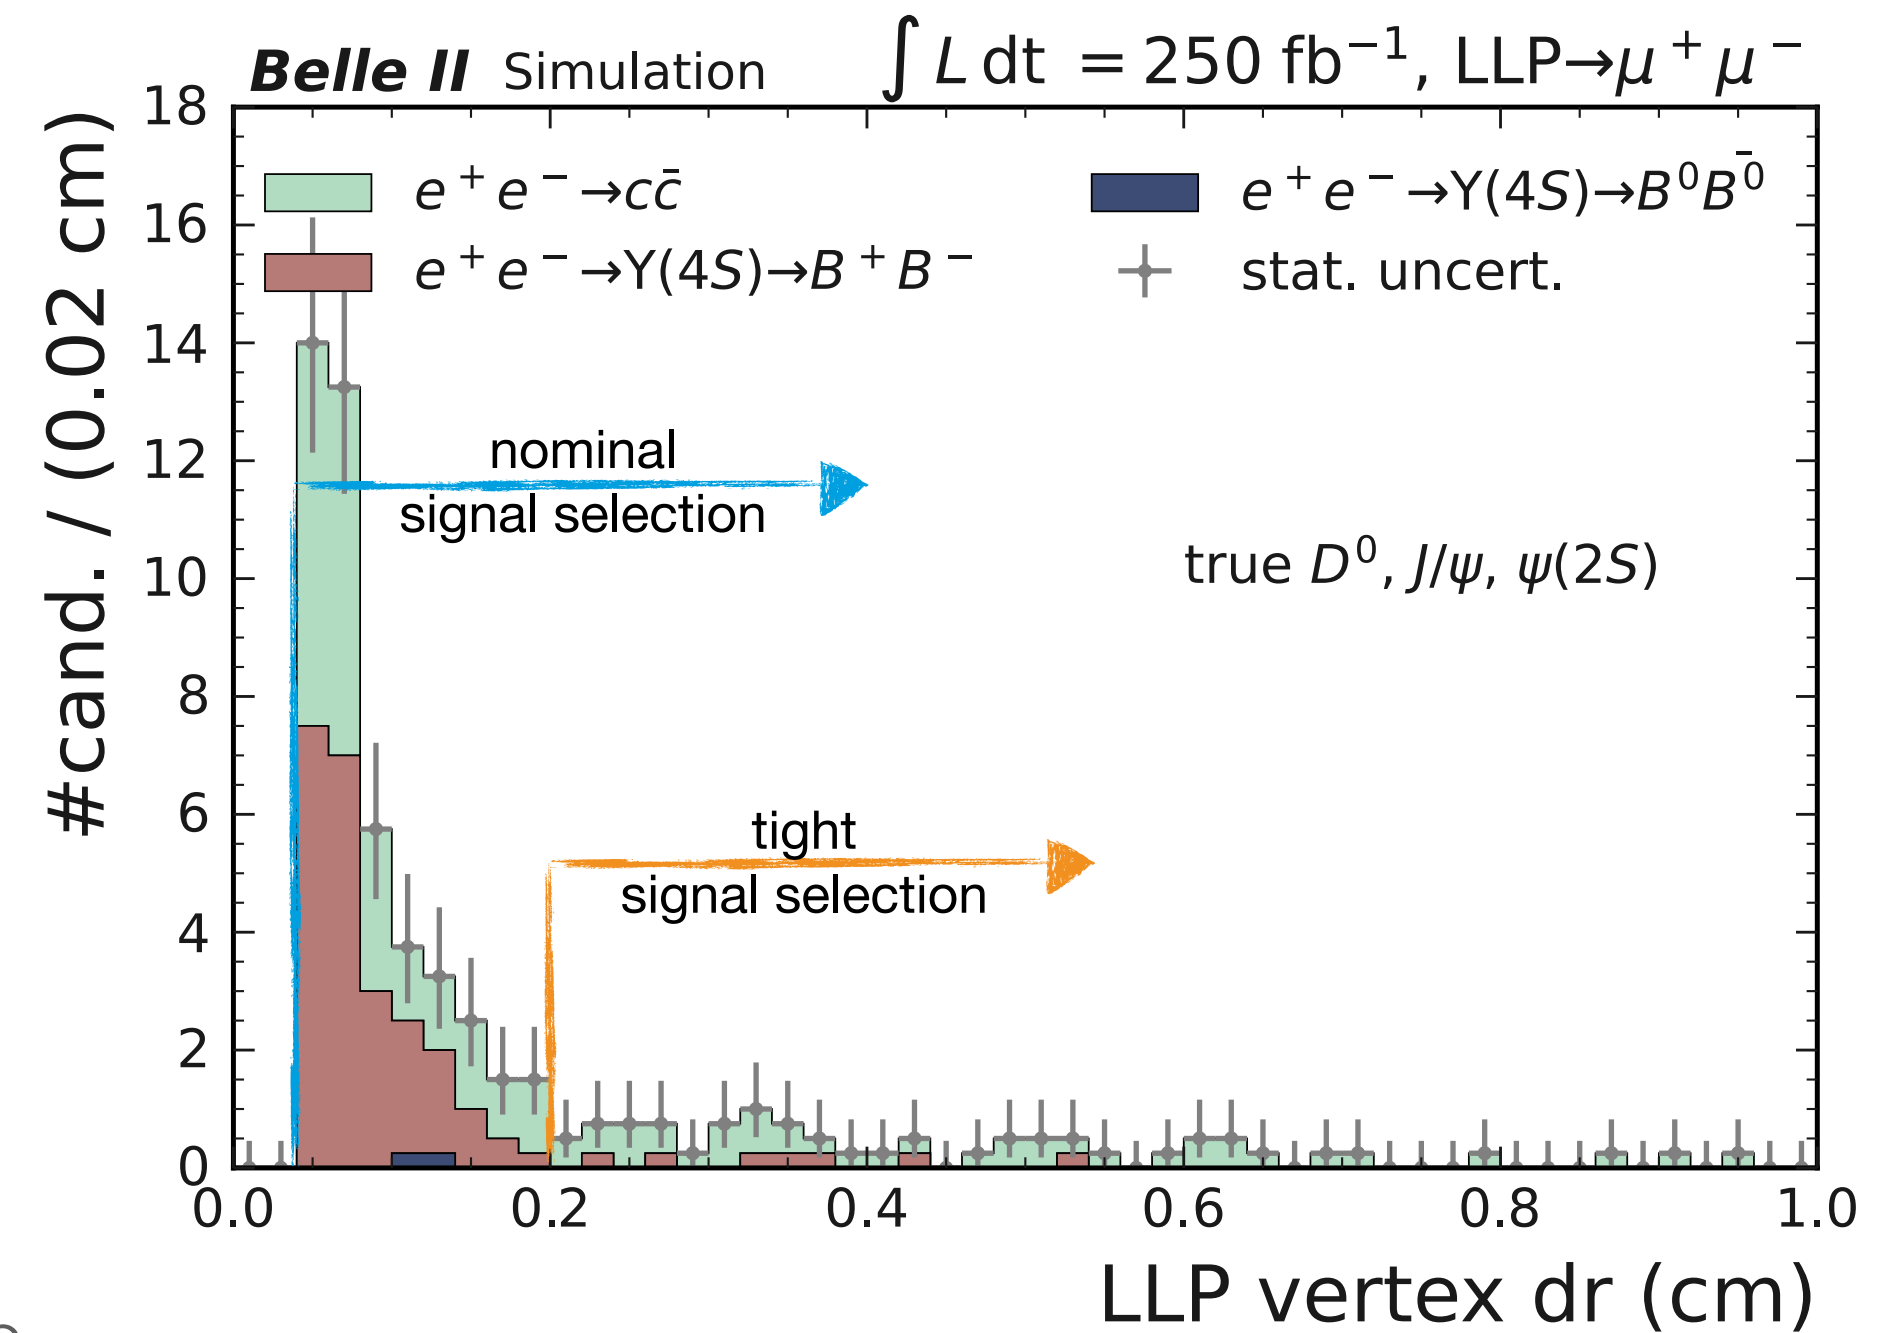

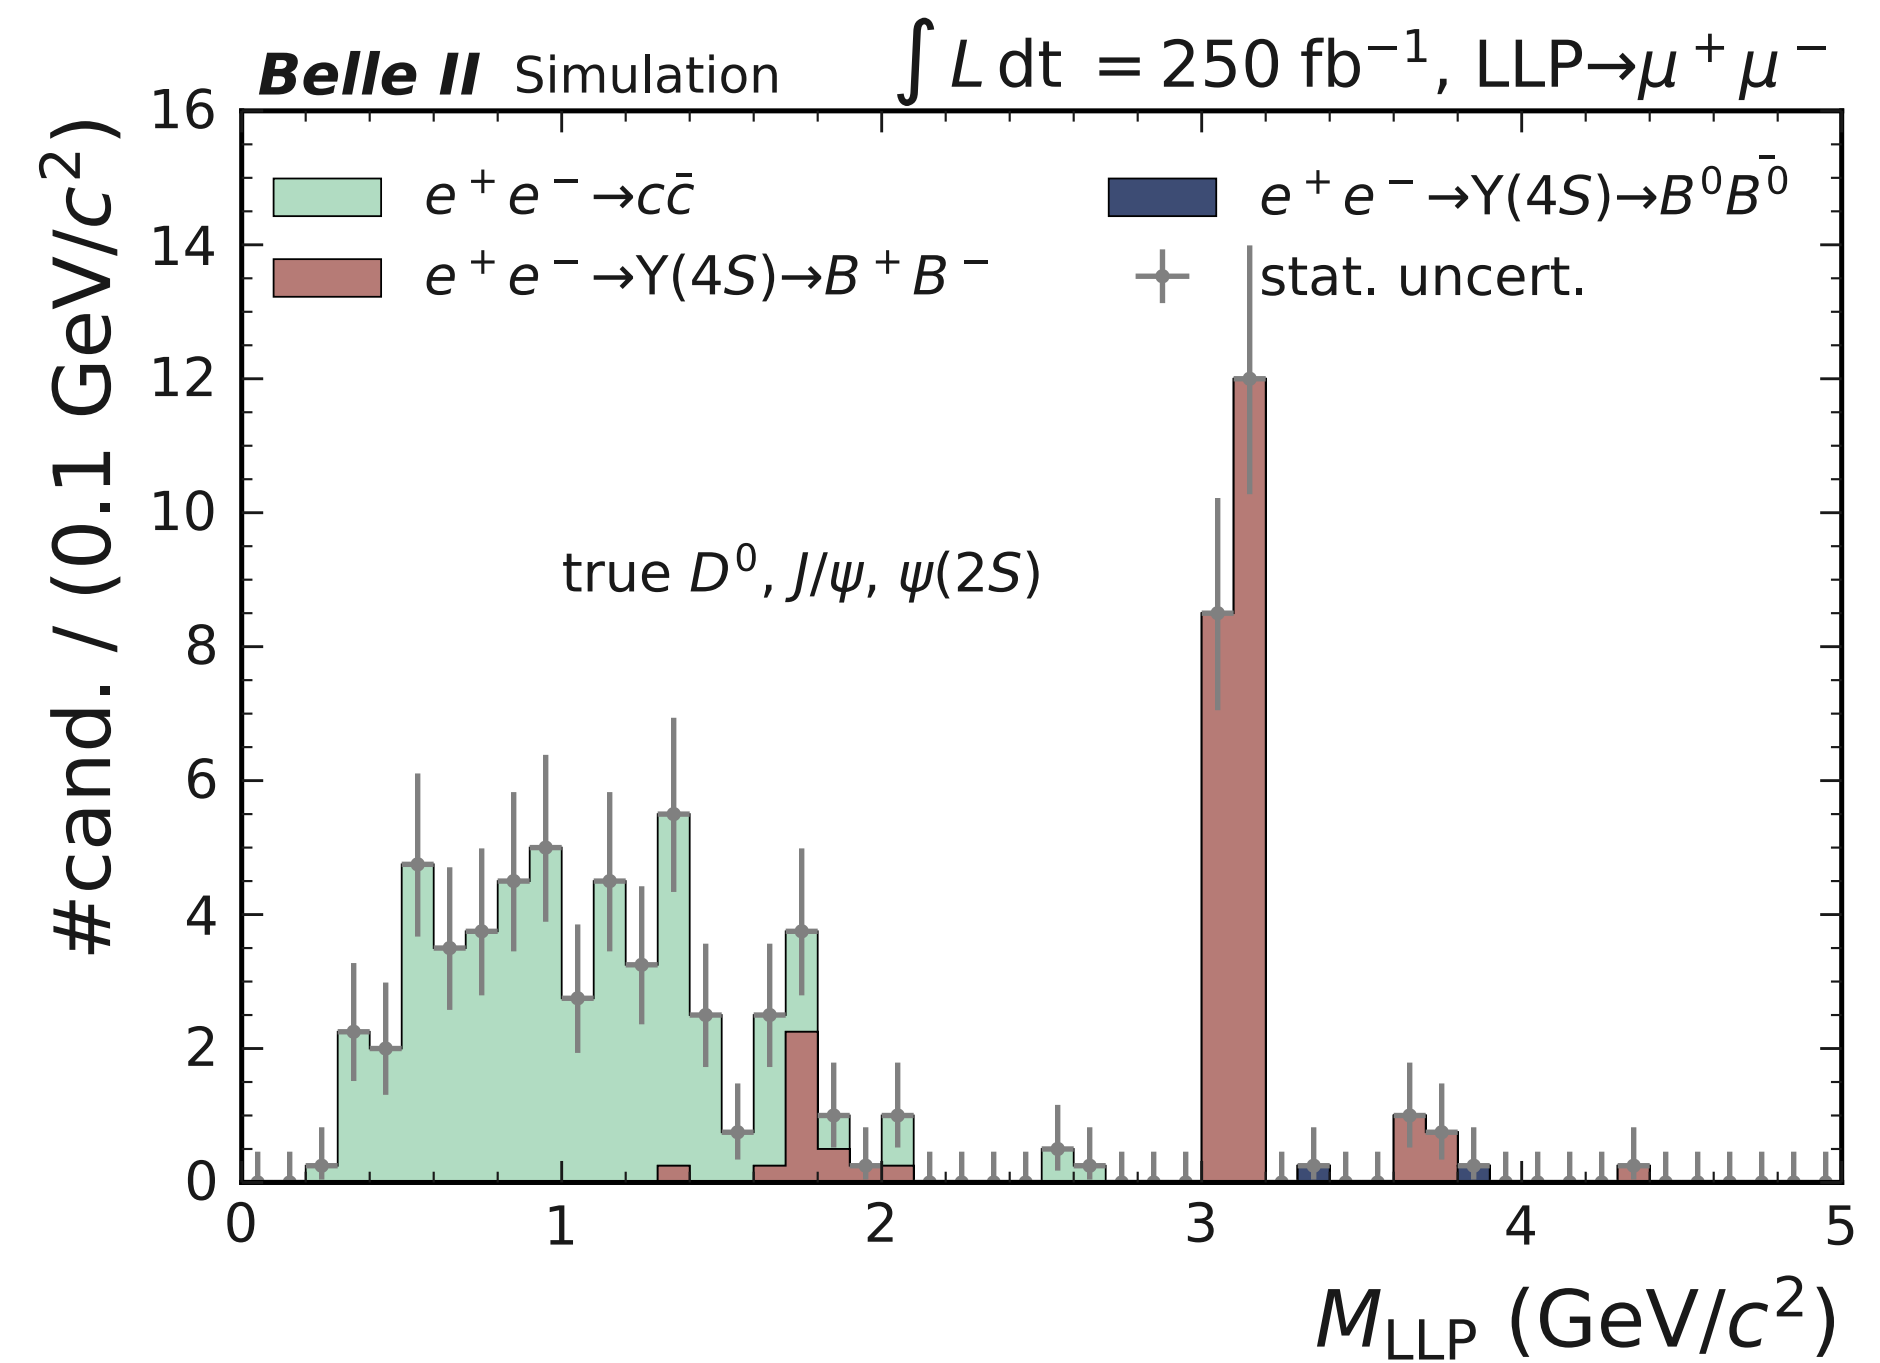

- Veto mass region around K_S^0 peak
- In all final-state channels using $M_{\pi^+\pi^-}$

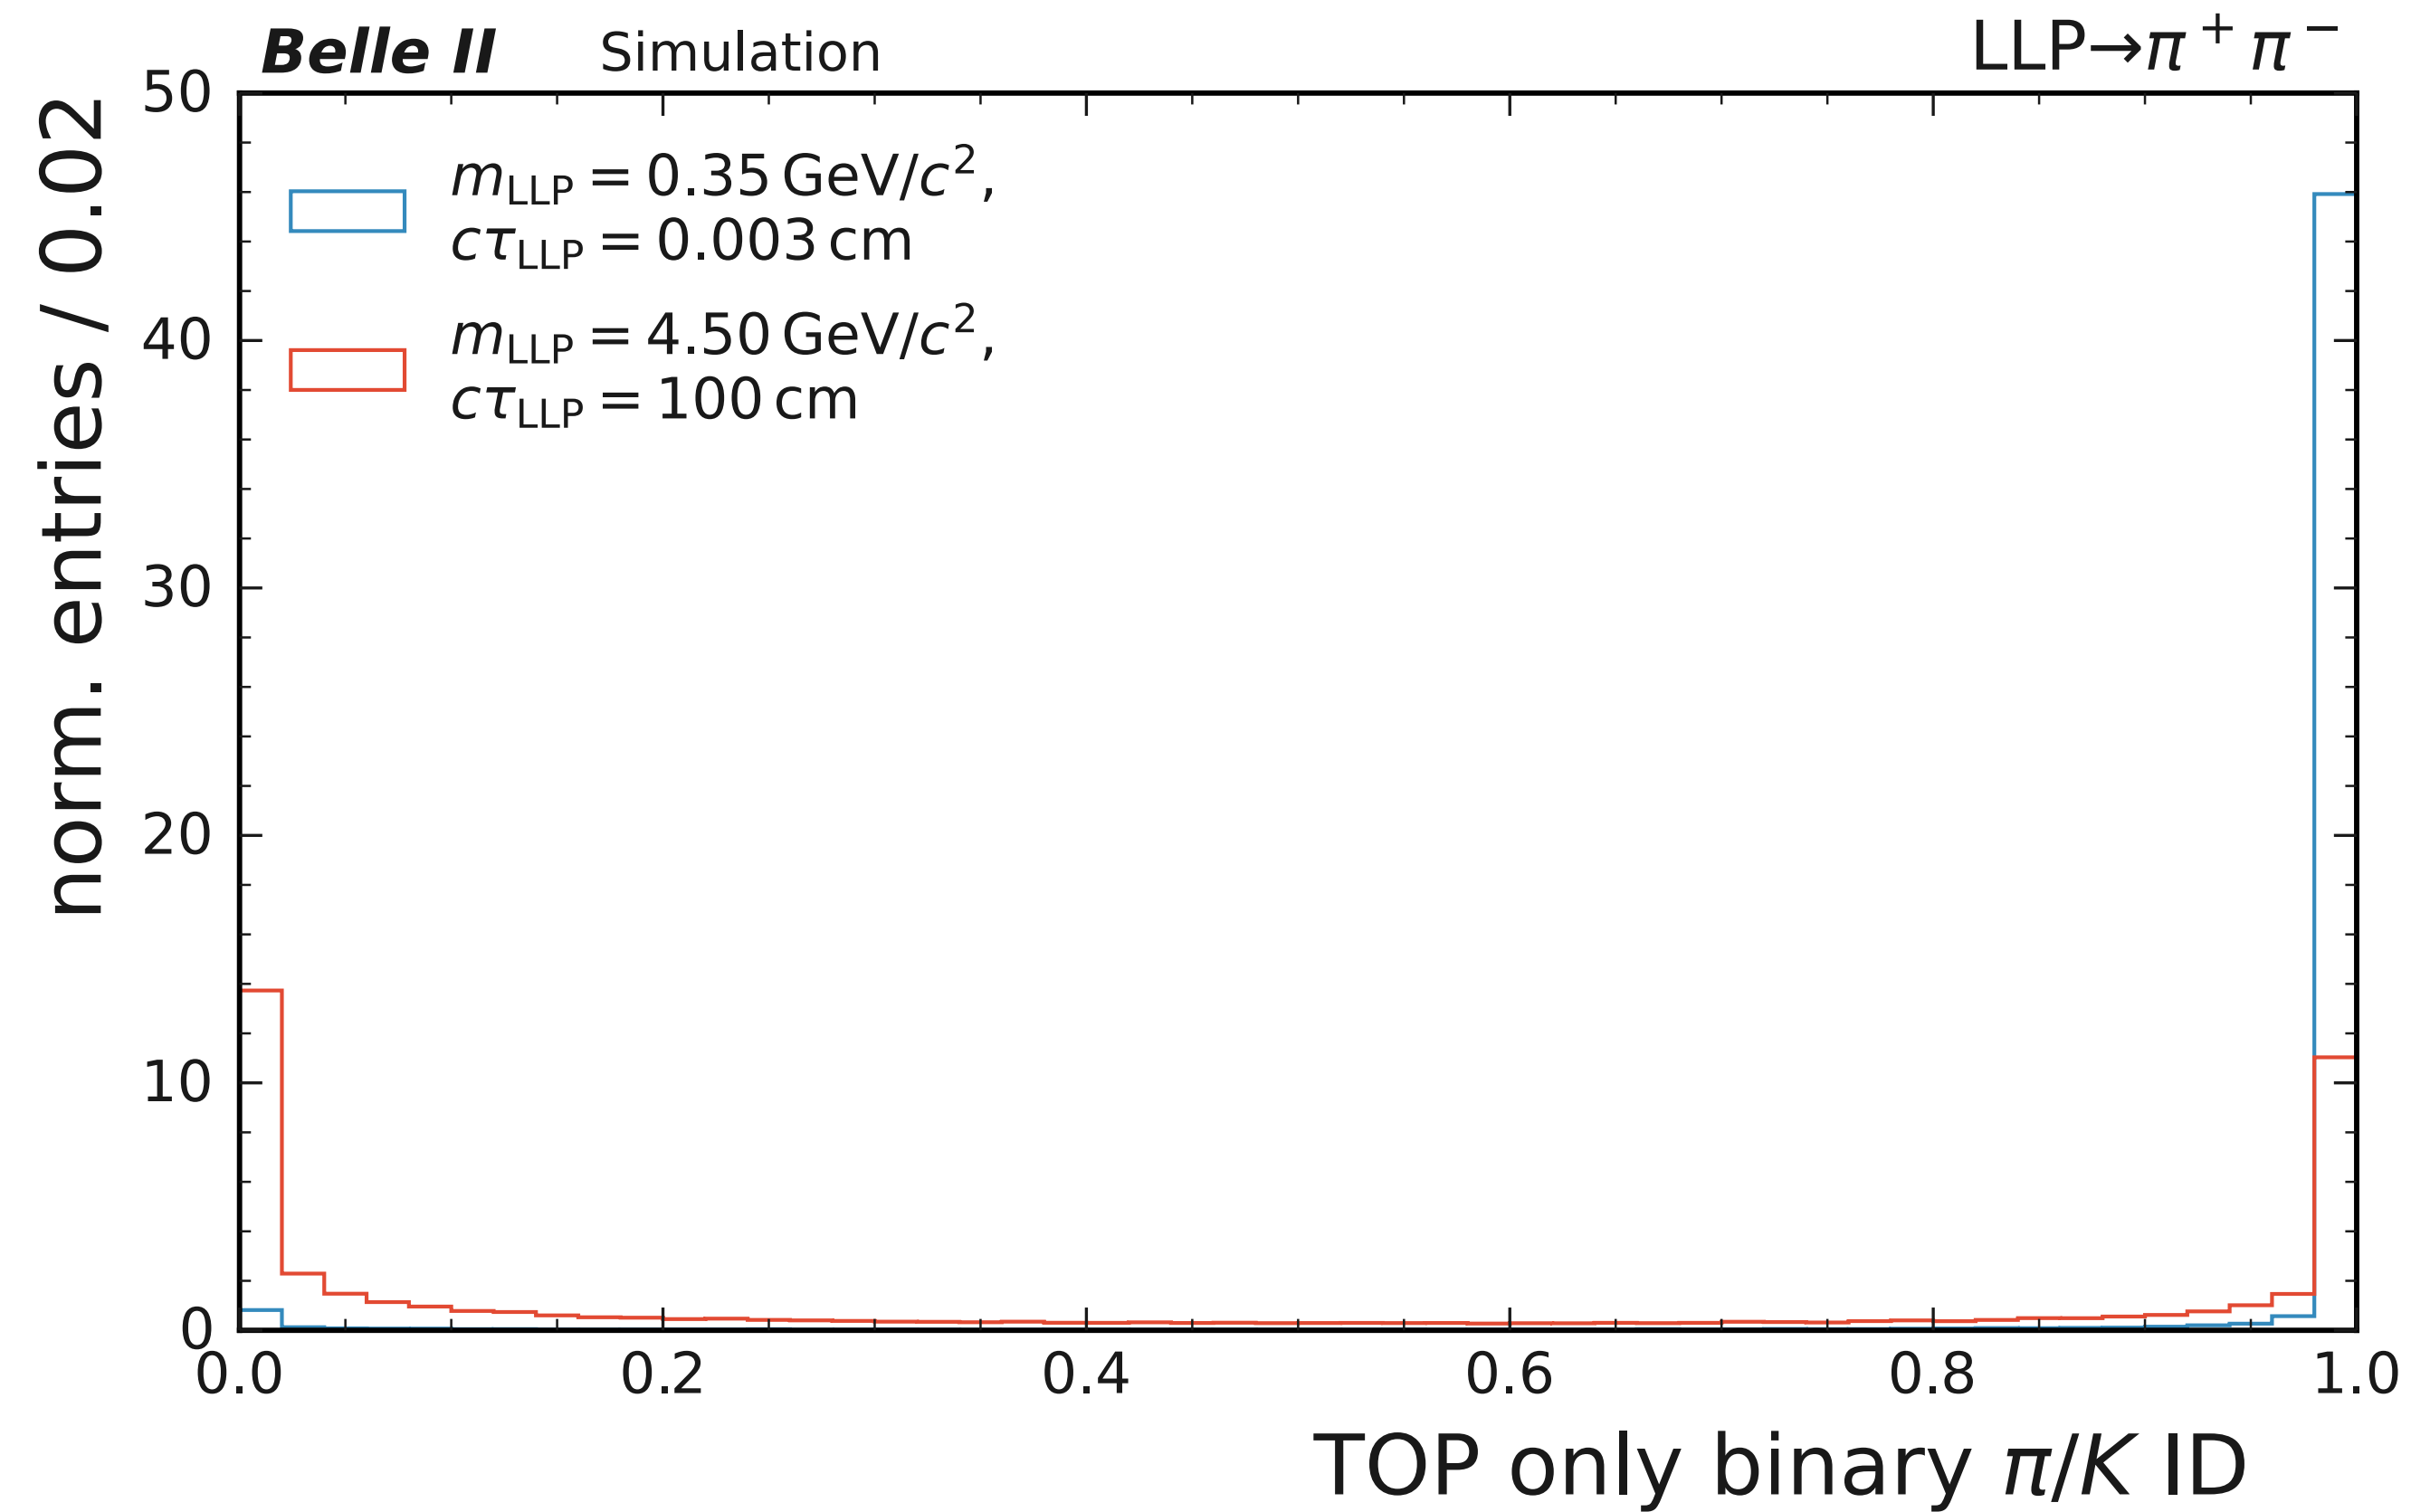

- Optimise a set of rectangular selections using the Punzi figure-of-merit

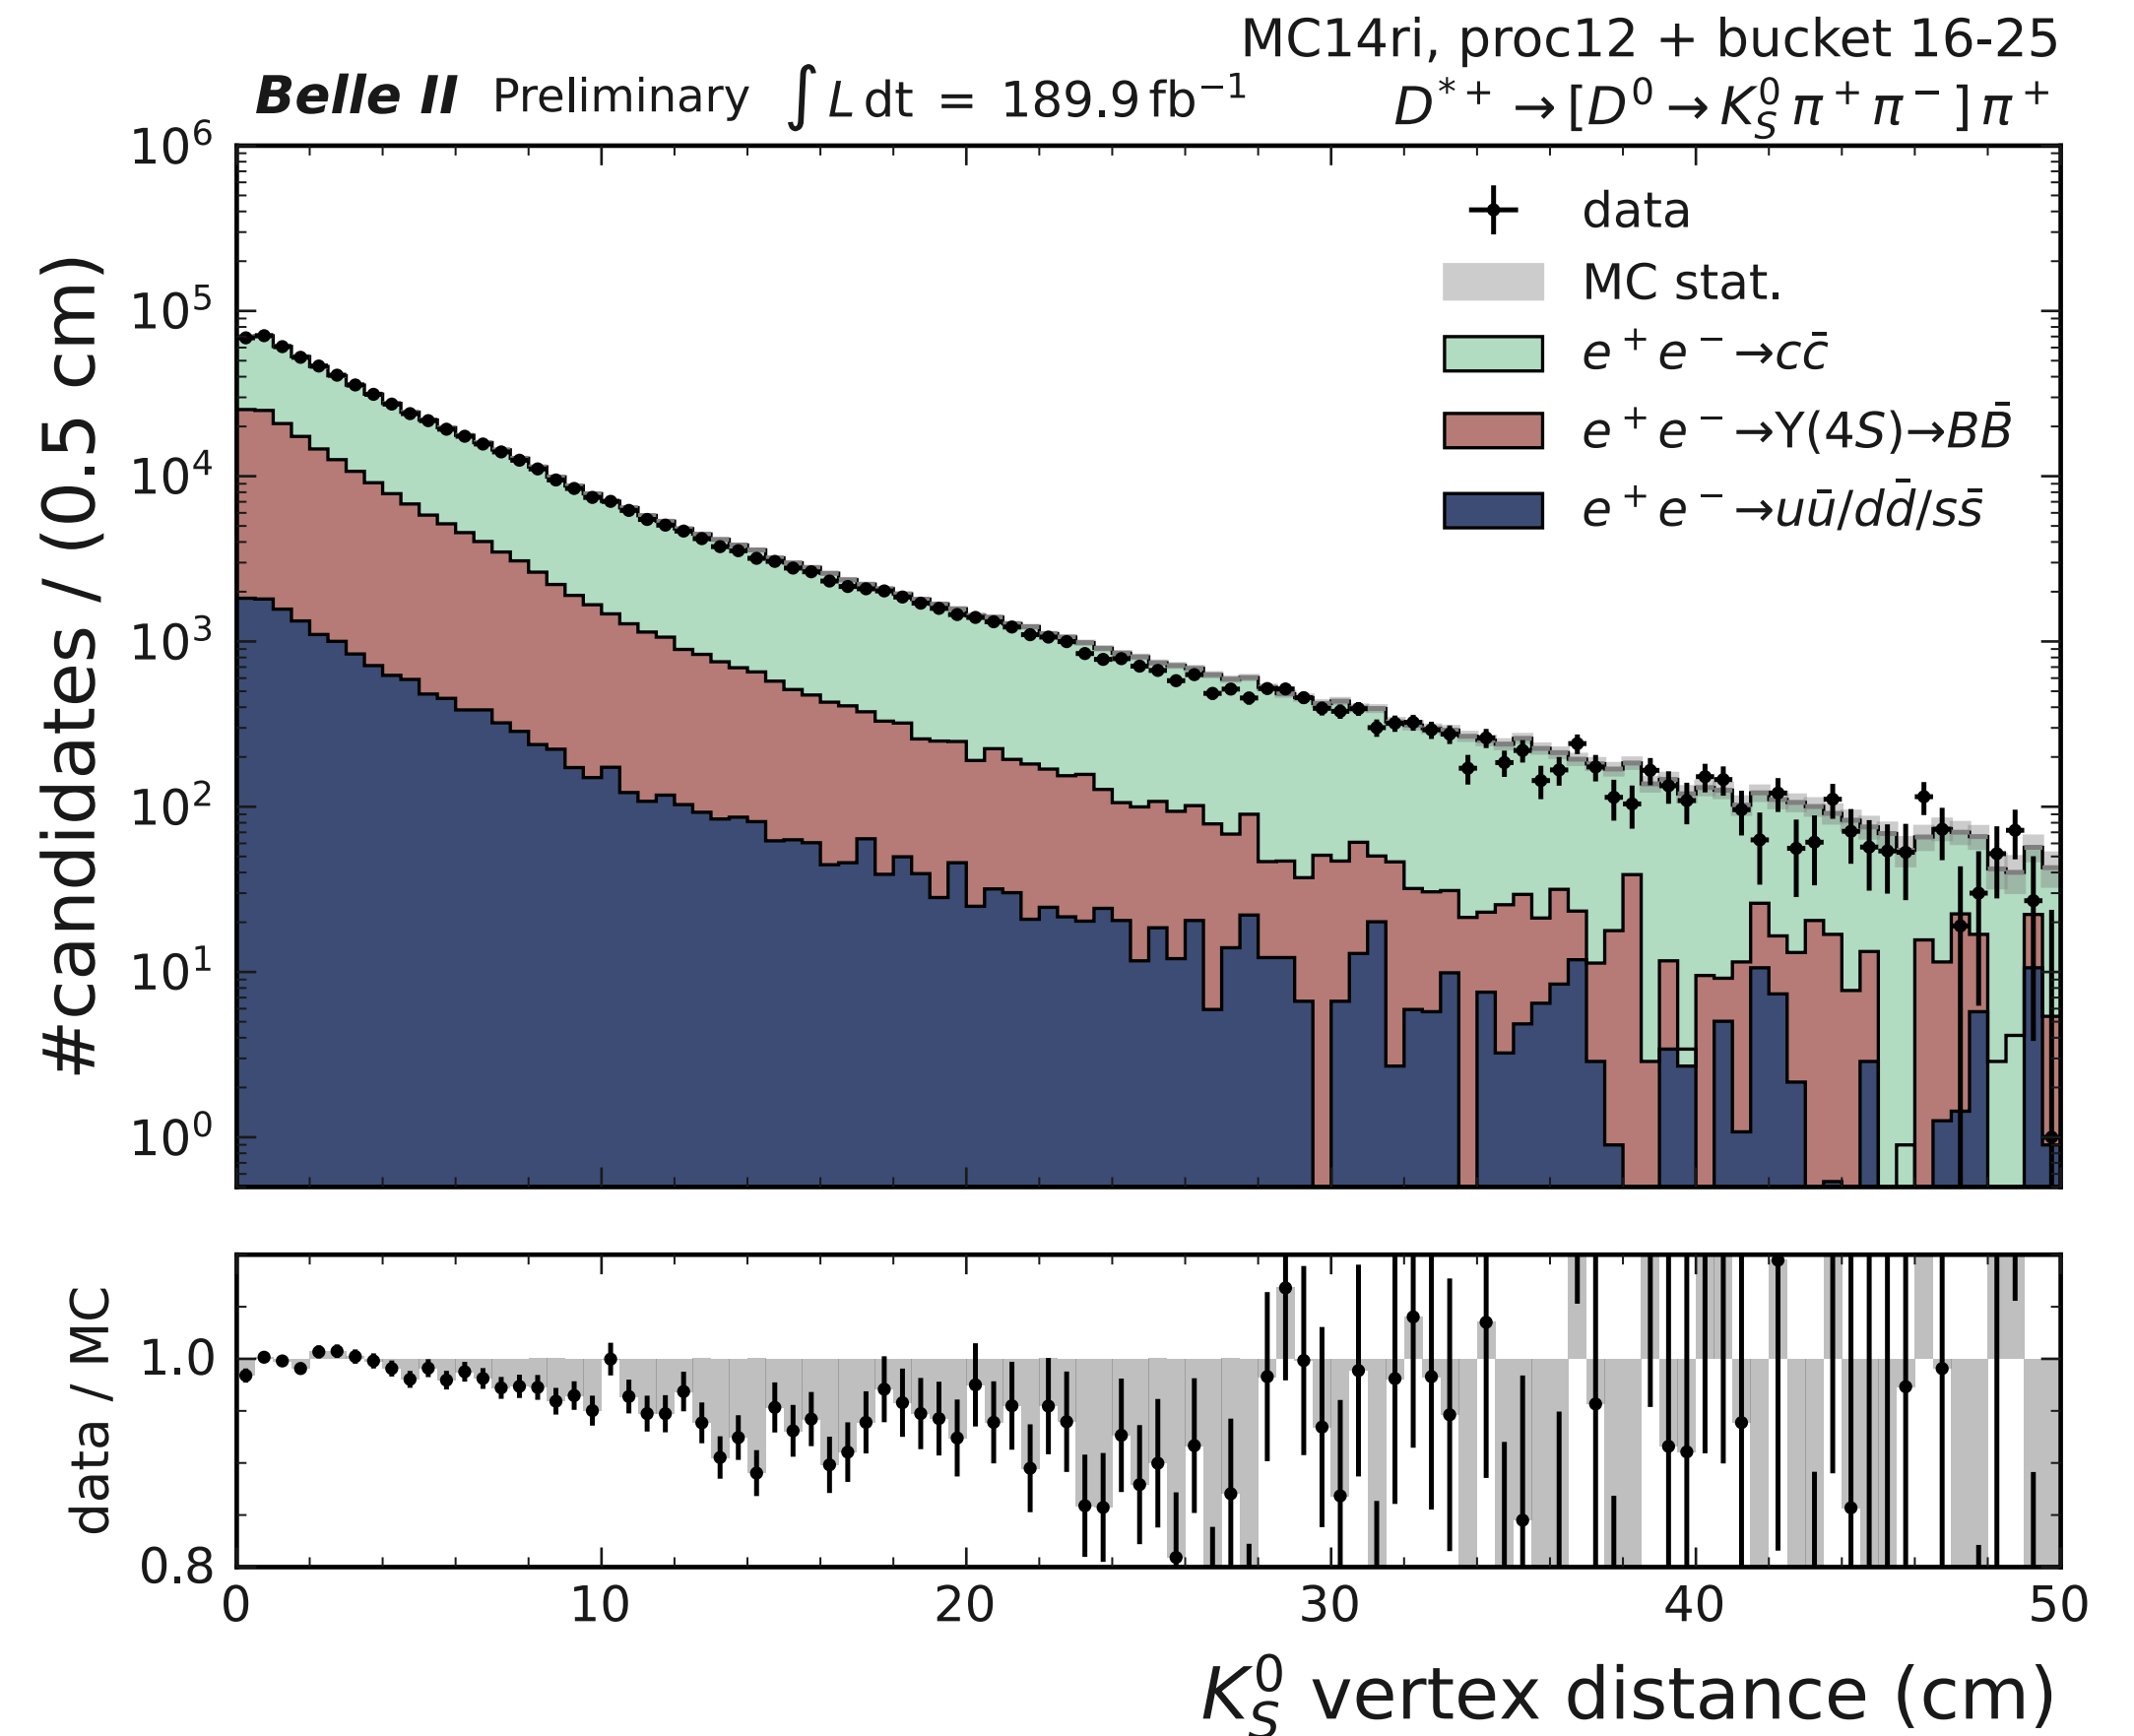

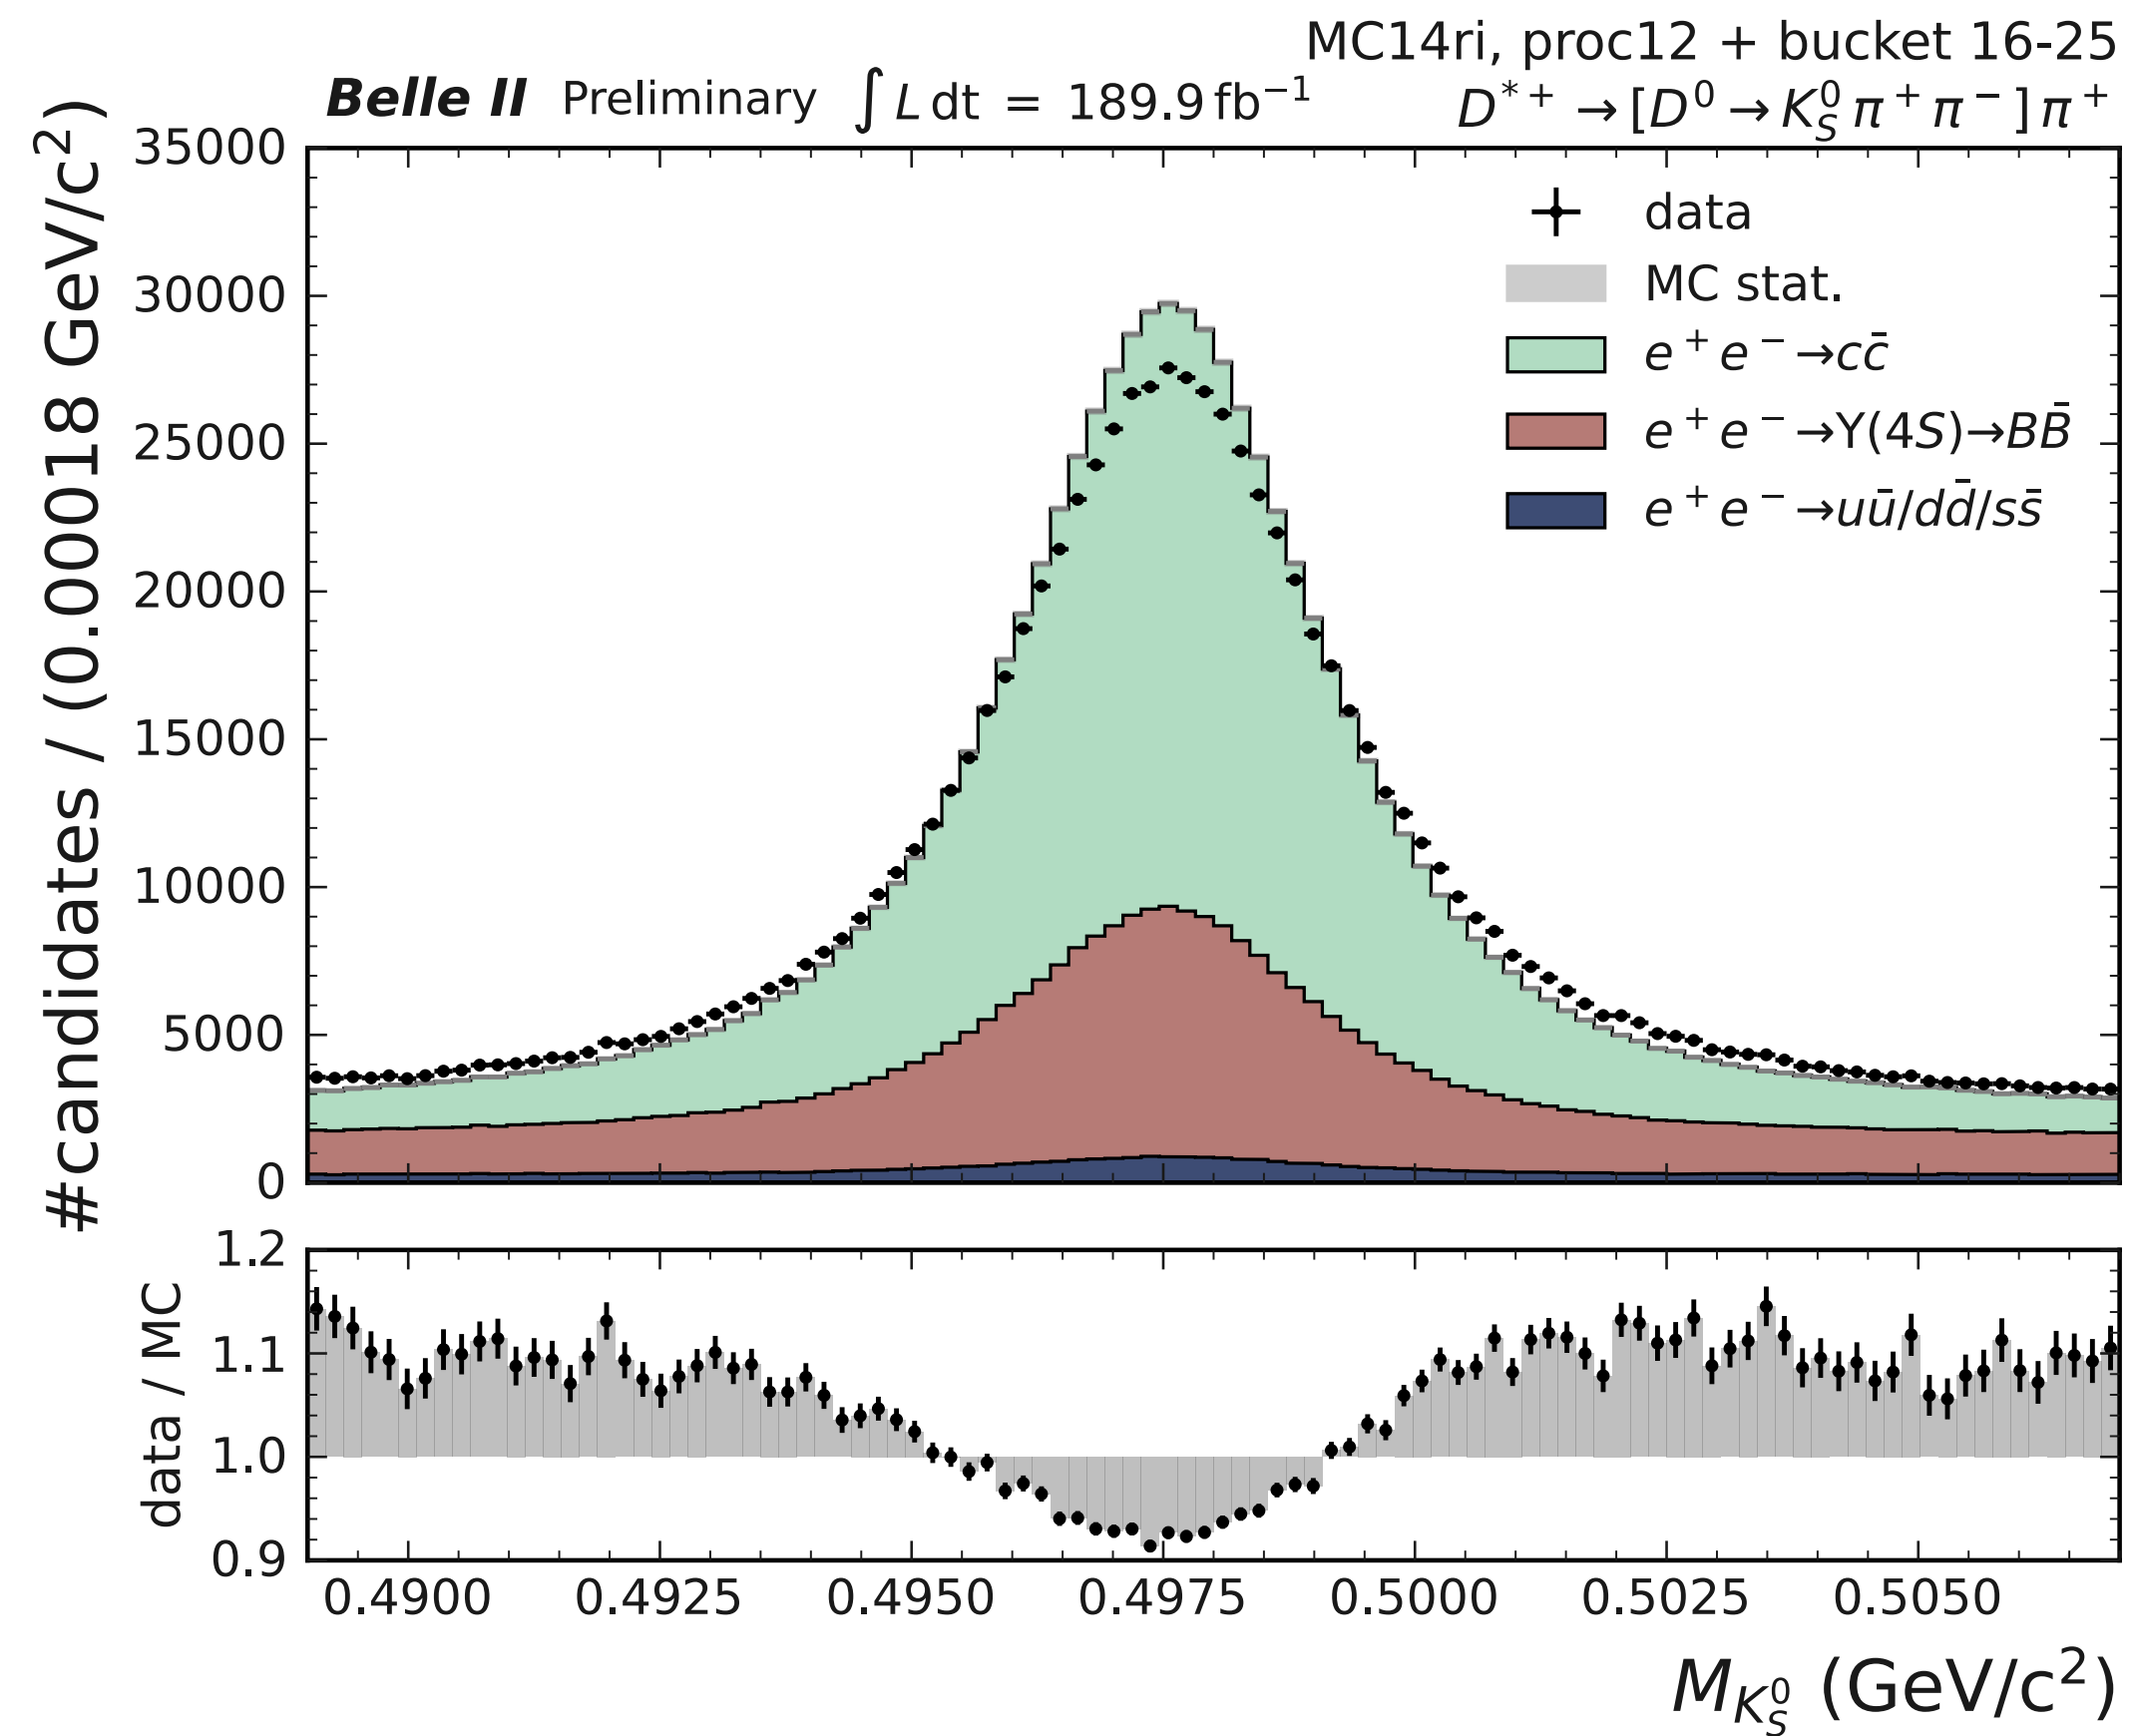

Selection — Peaking B decays rejection.

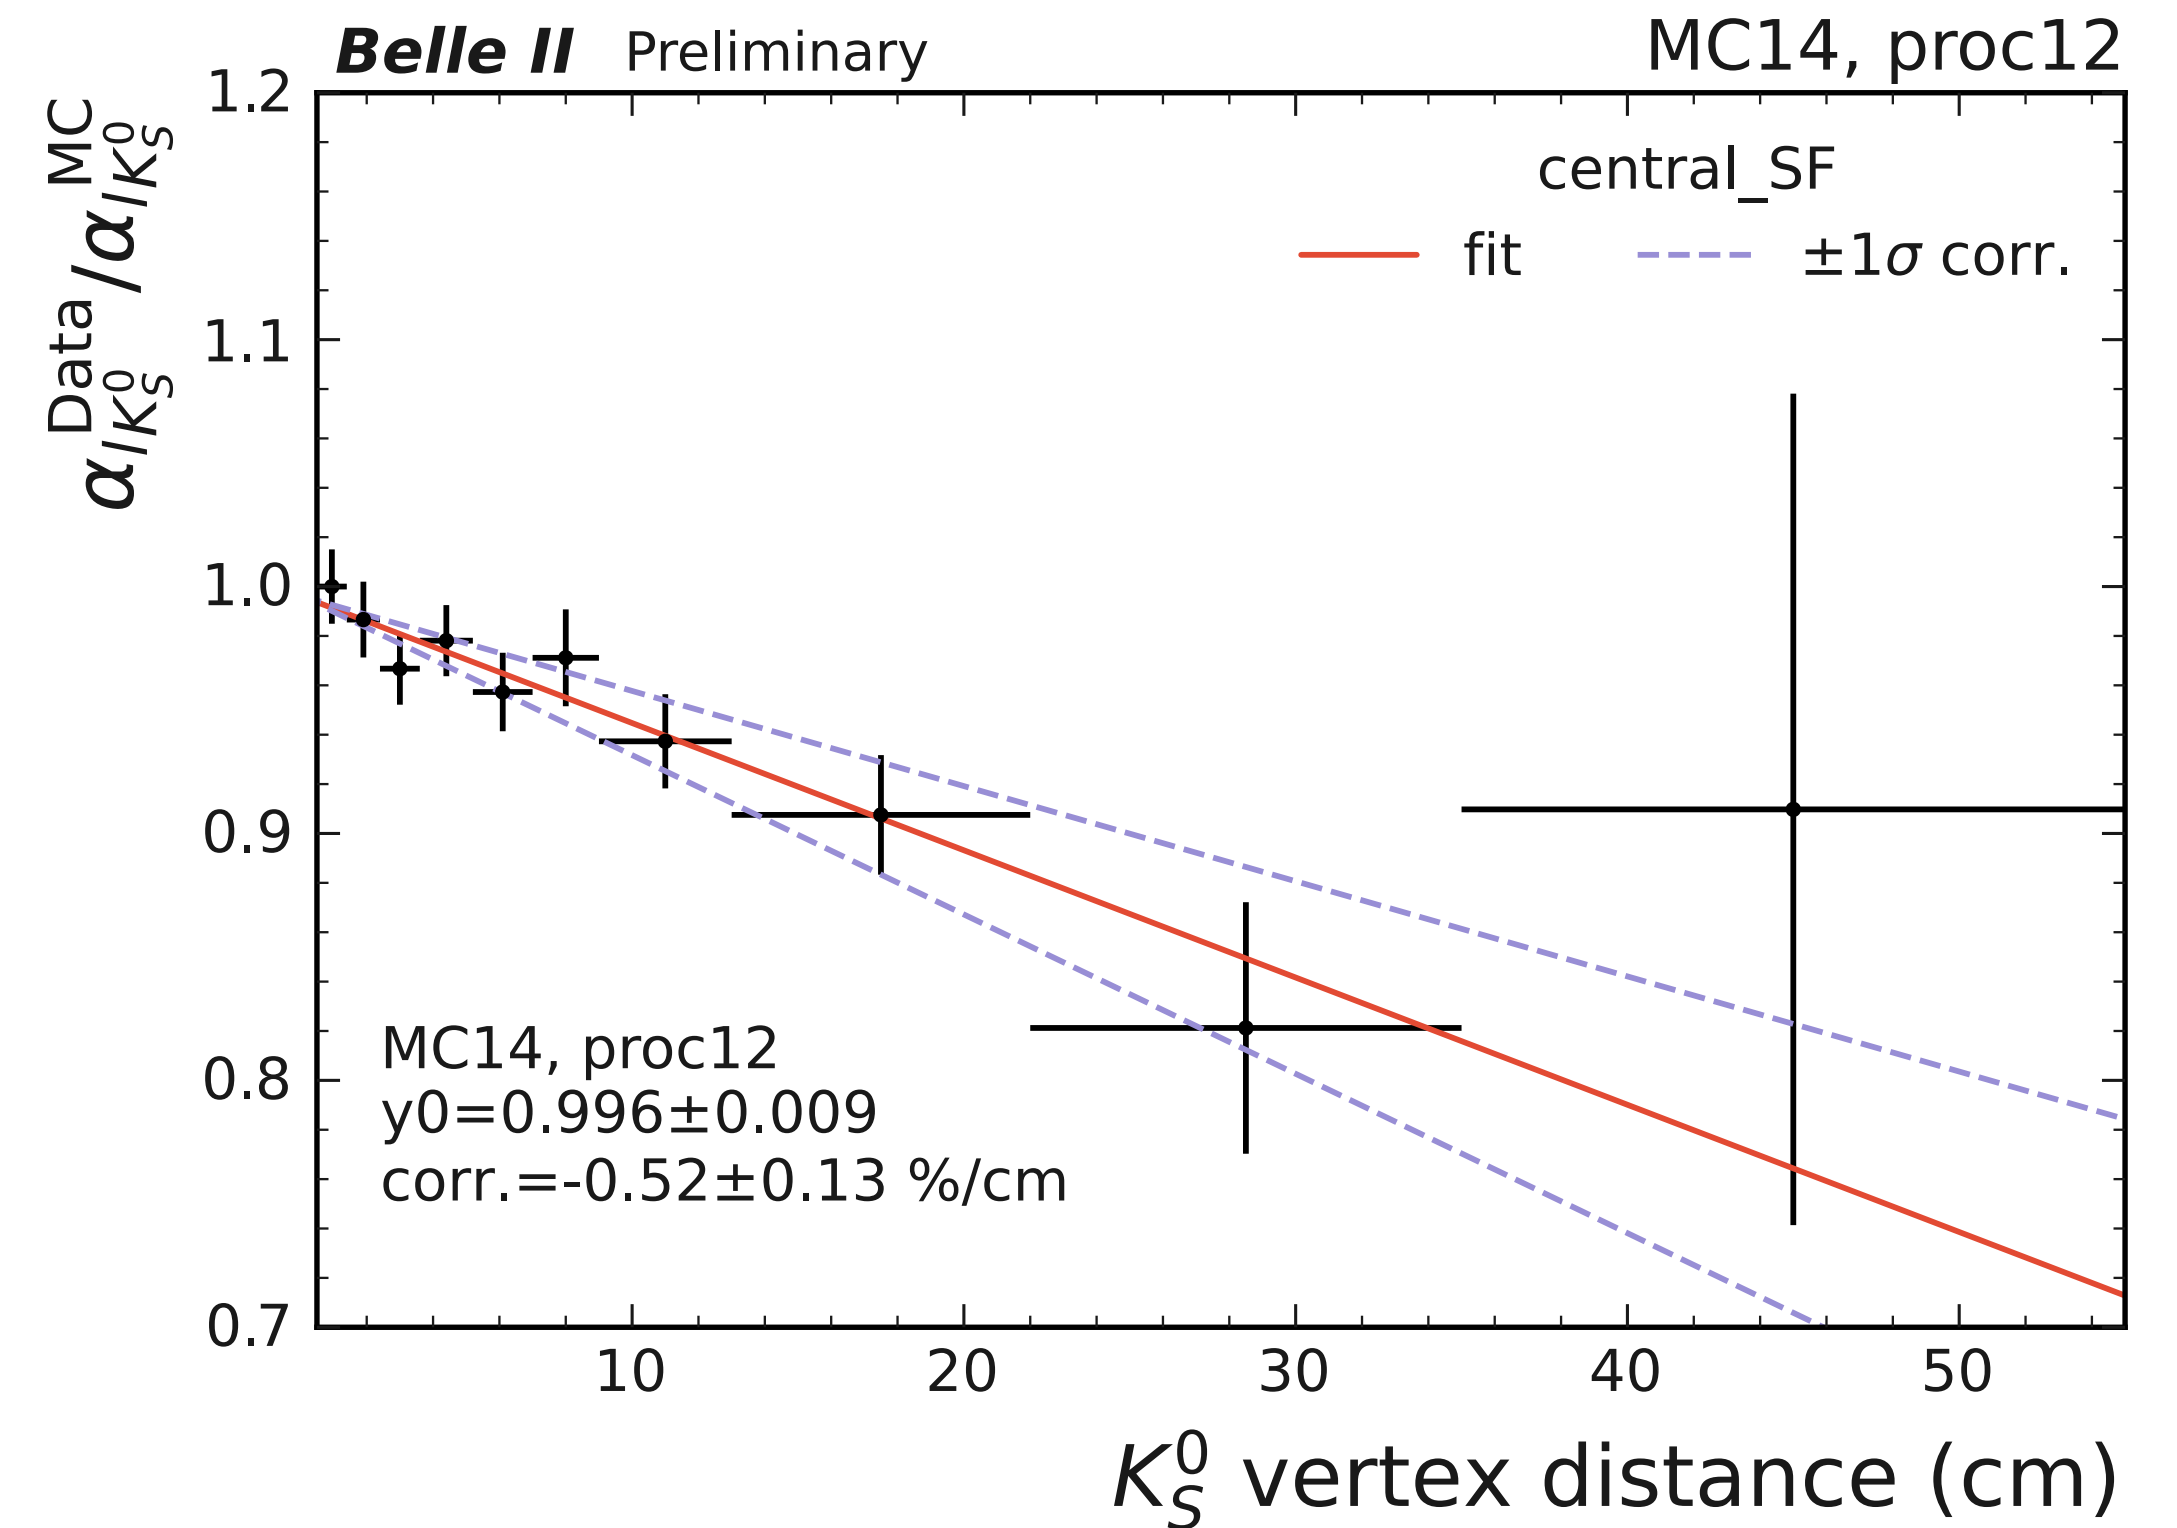

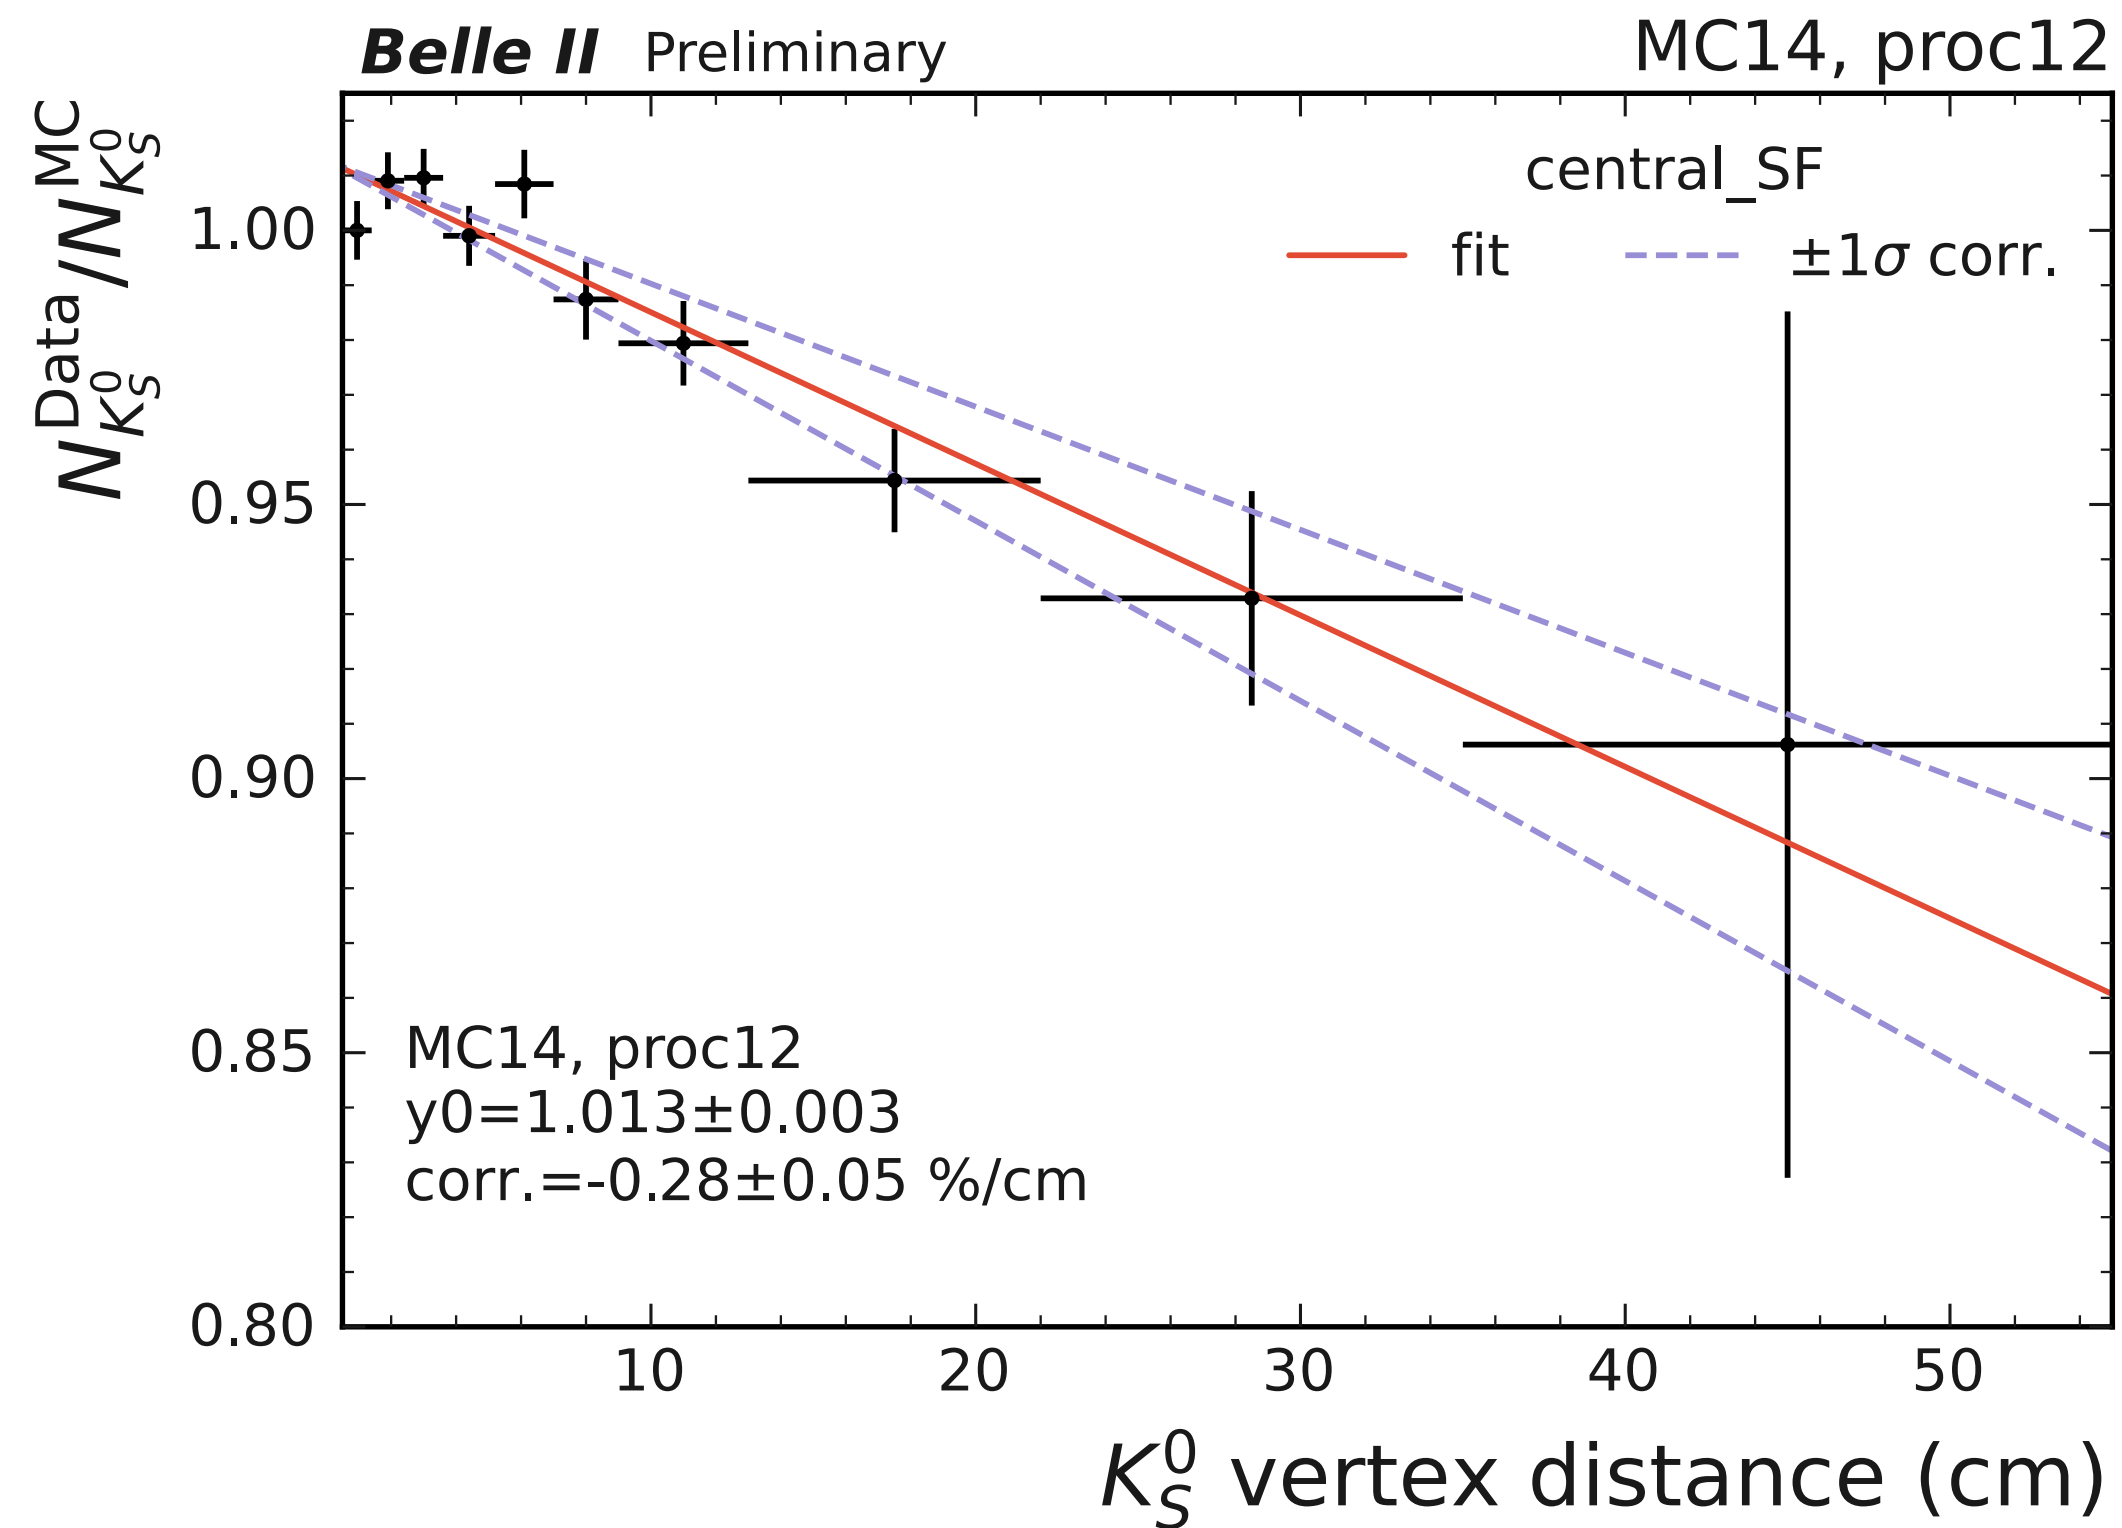

- Tighten selections in vertex displacement

- Default PID performs poorly for daughters of highly displaced LLPs
- Excluding TOP likelihood and restricting tested particle hypotheses recovers performance

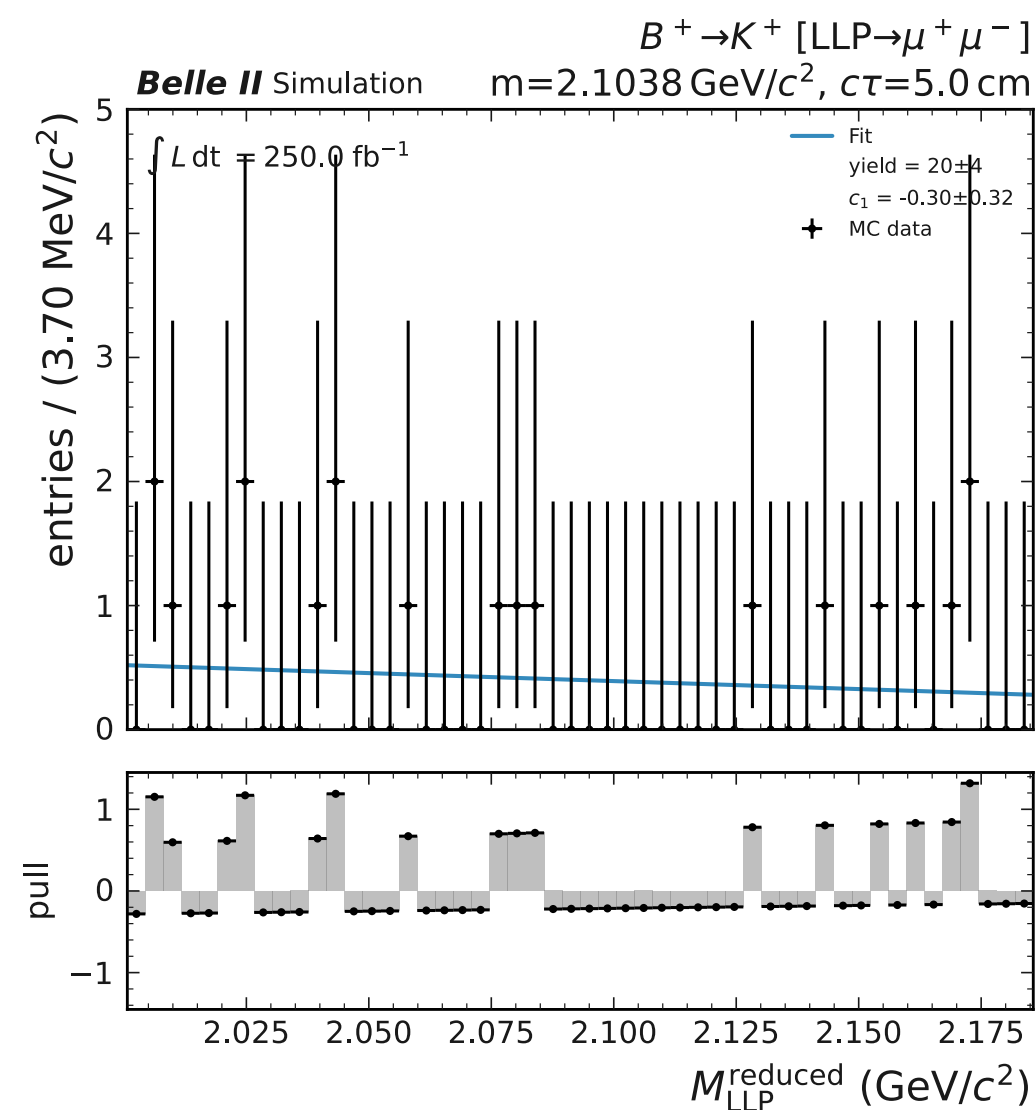

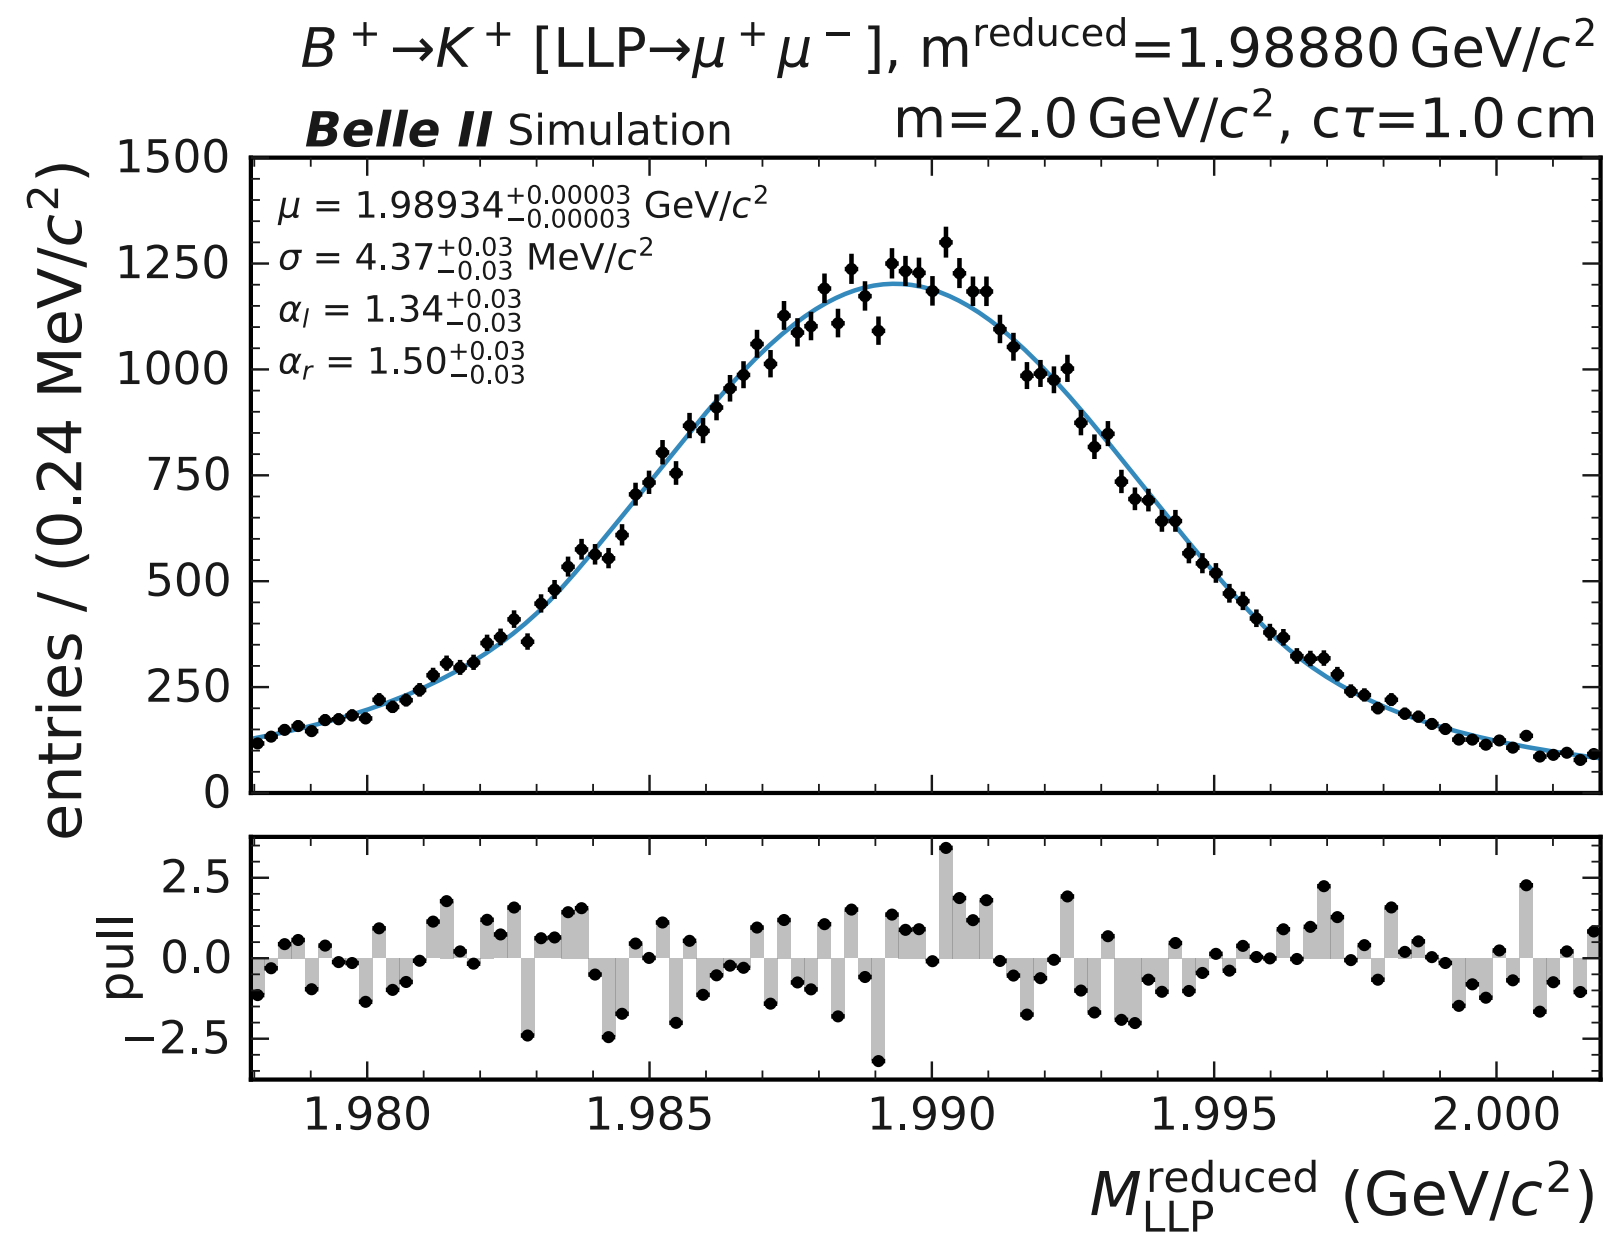

- The vetoed K_S^0 are used to study LLP performance

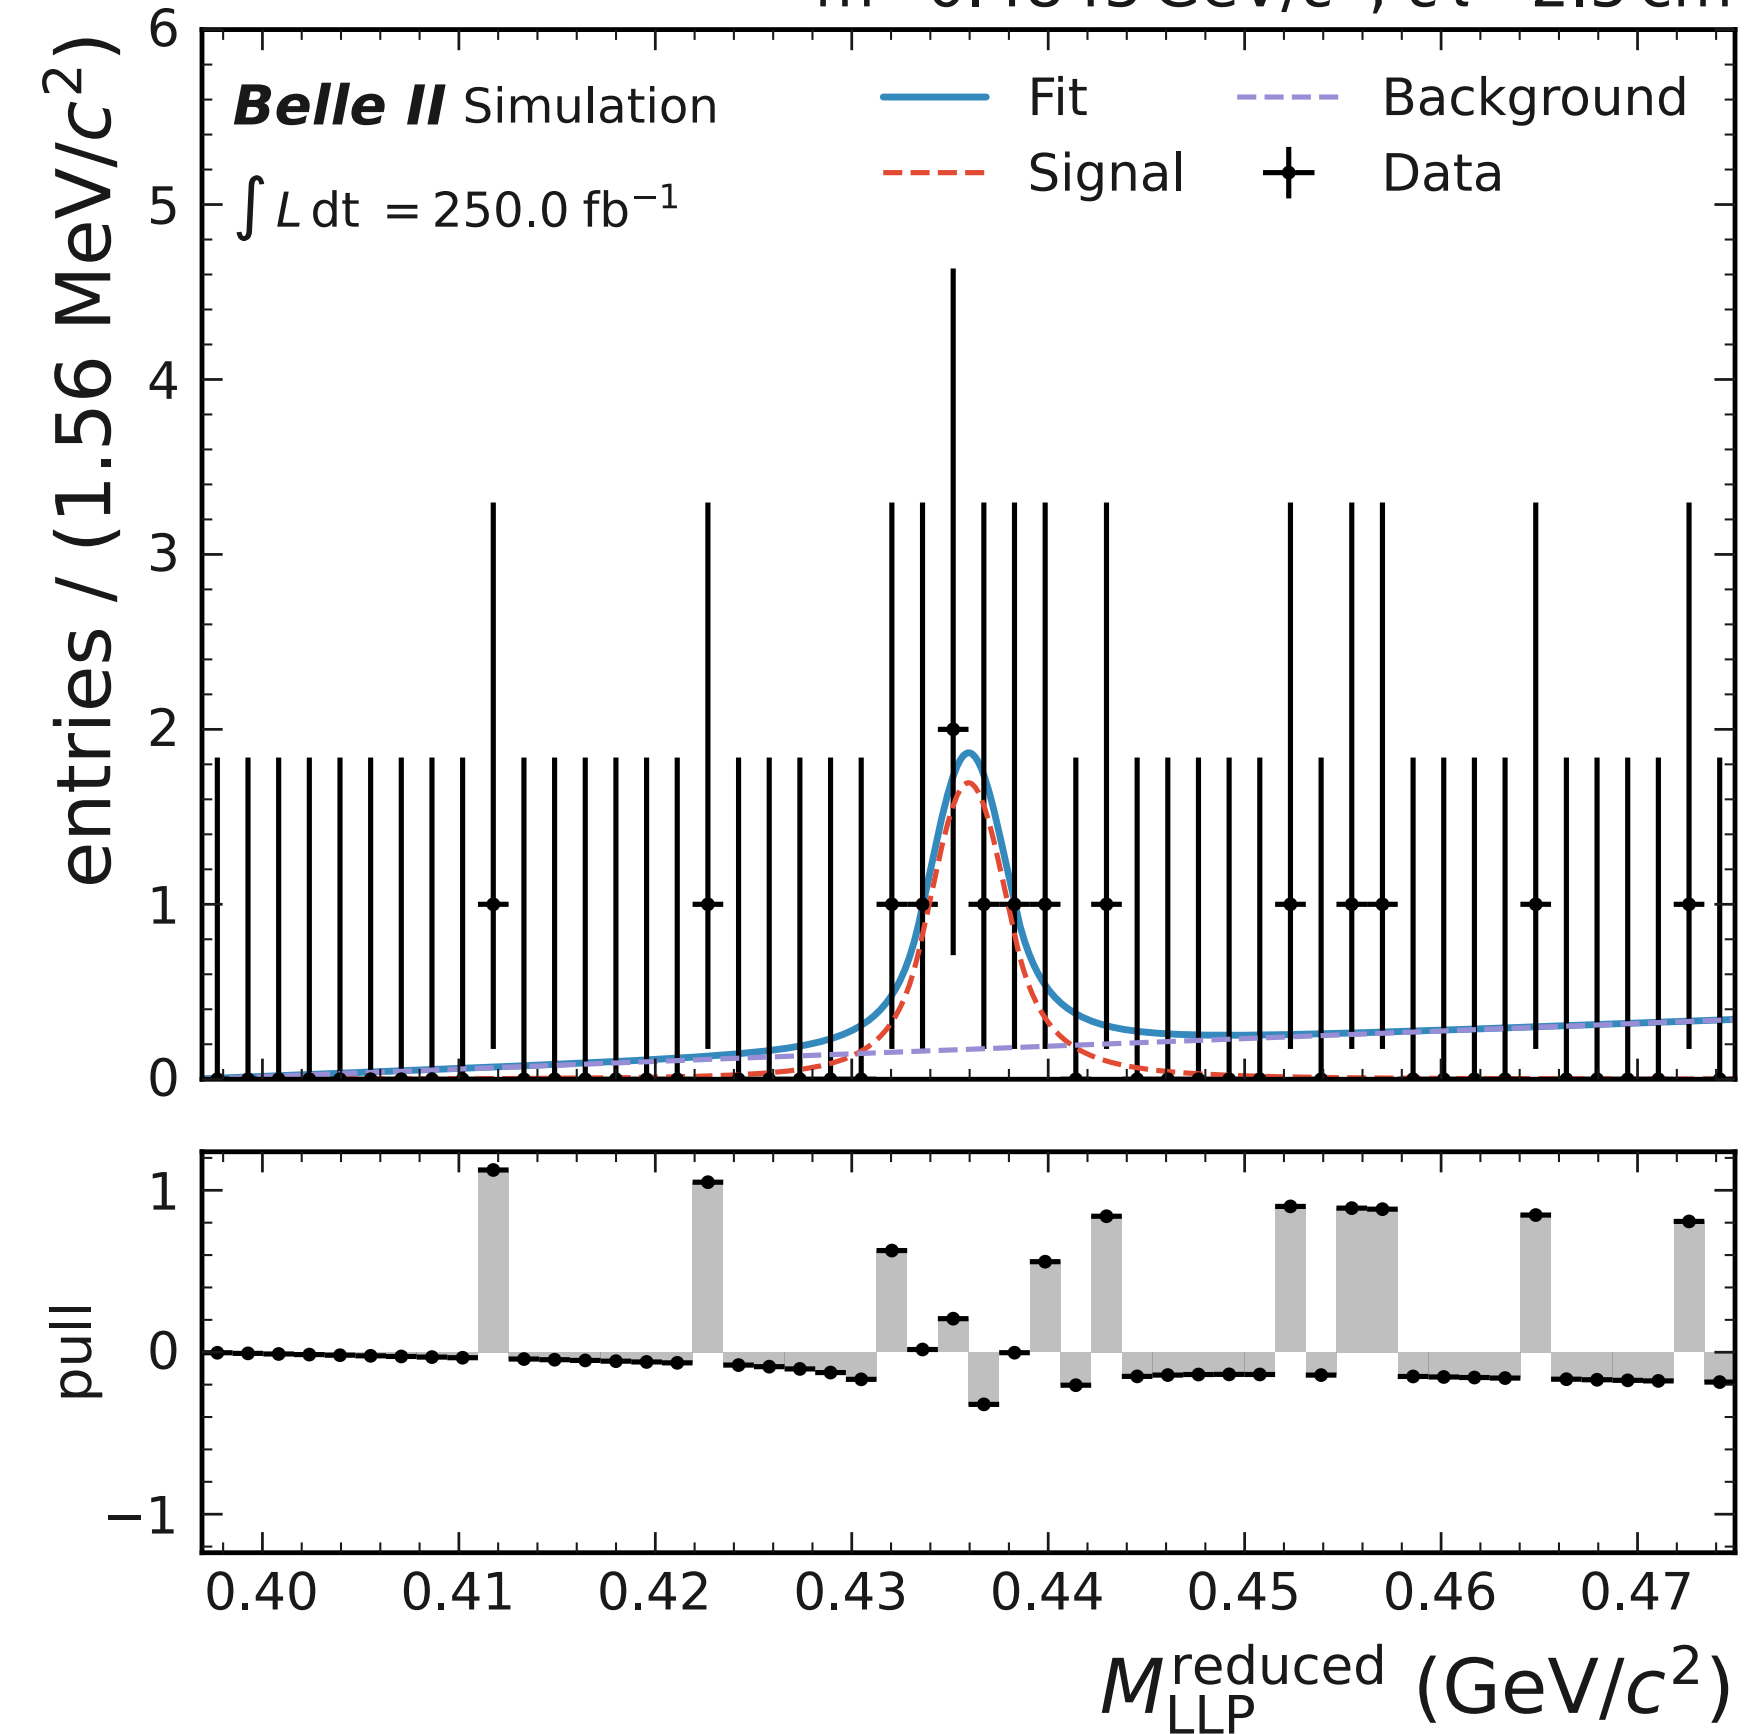

- K_S^0 data/MC discrepancy is used to determine correction factors
- Corrections on LLP efficiency & template parameters as a function of vertex displacement

Signal extraction.

$$M_{LLP}^{\text{reduced}} = \sqrt{M_{LLP}^2 - 4m_{\text{final-state}}^2}$$

$B^+ \rightarrow K^+ [LLP \rightarrow \mu^+ \mu^-]$
 $m = 0.4845 \text{ GeV}/c^2$, $c\tau = 2.5 \text{ cm}$

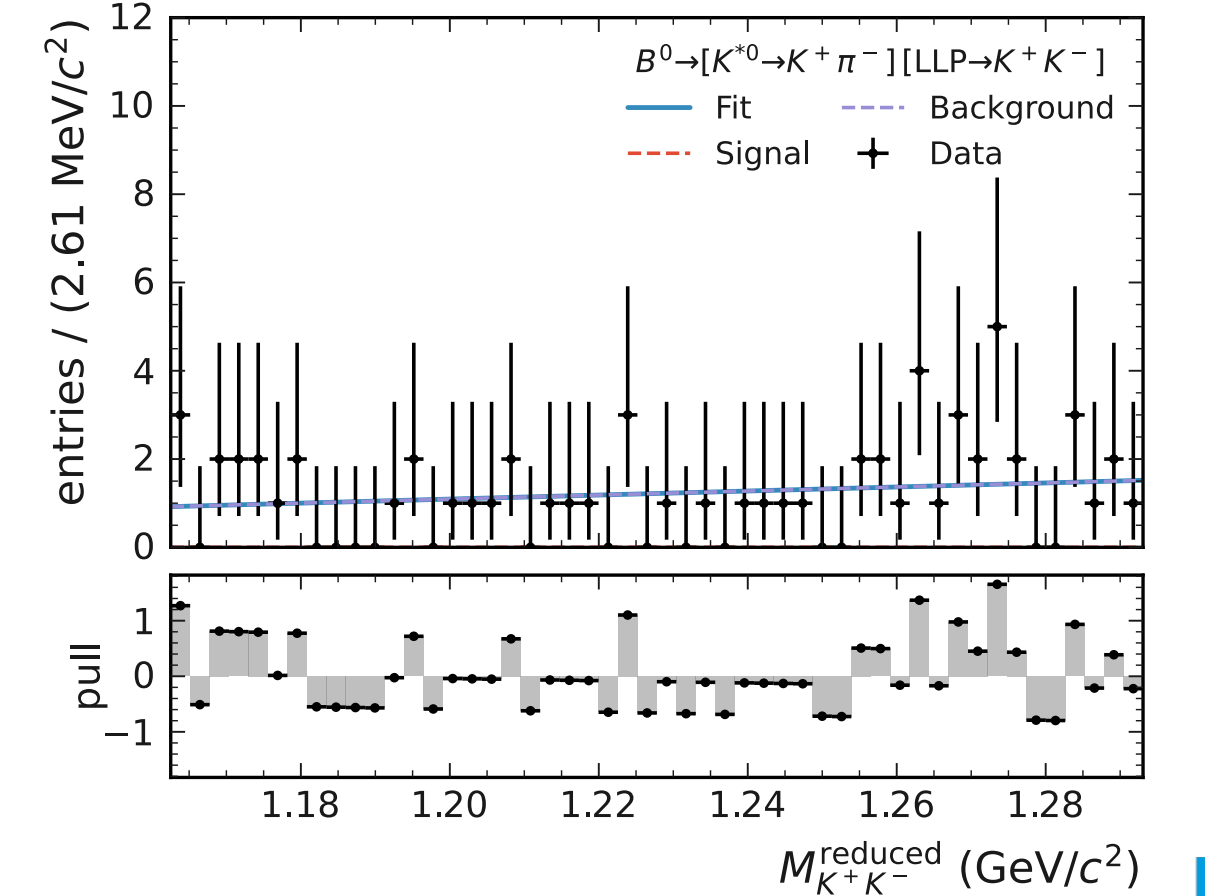

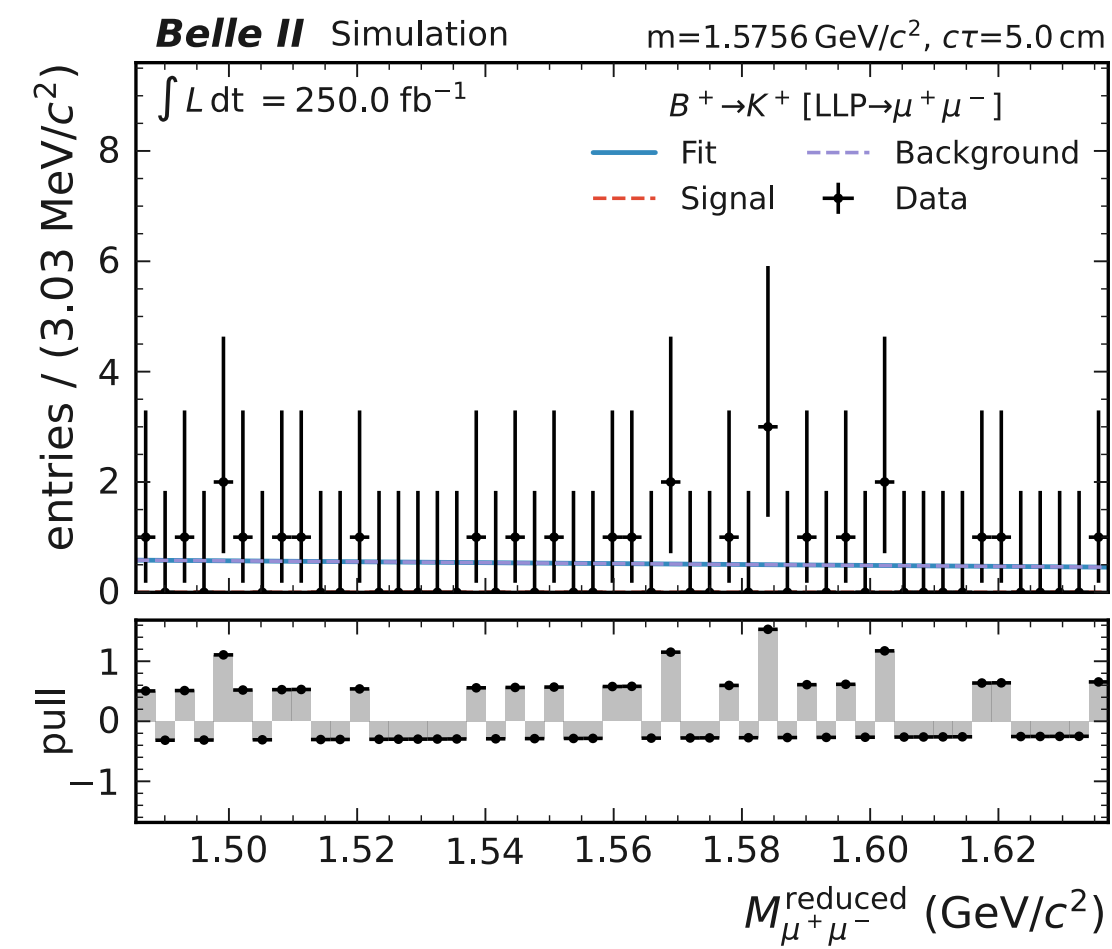

signal

background

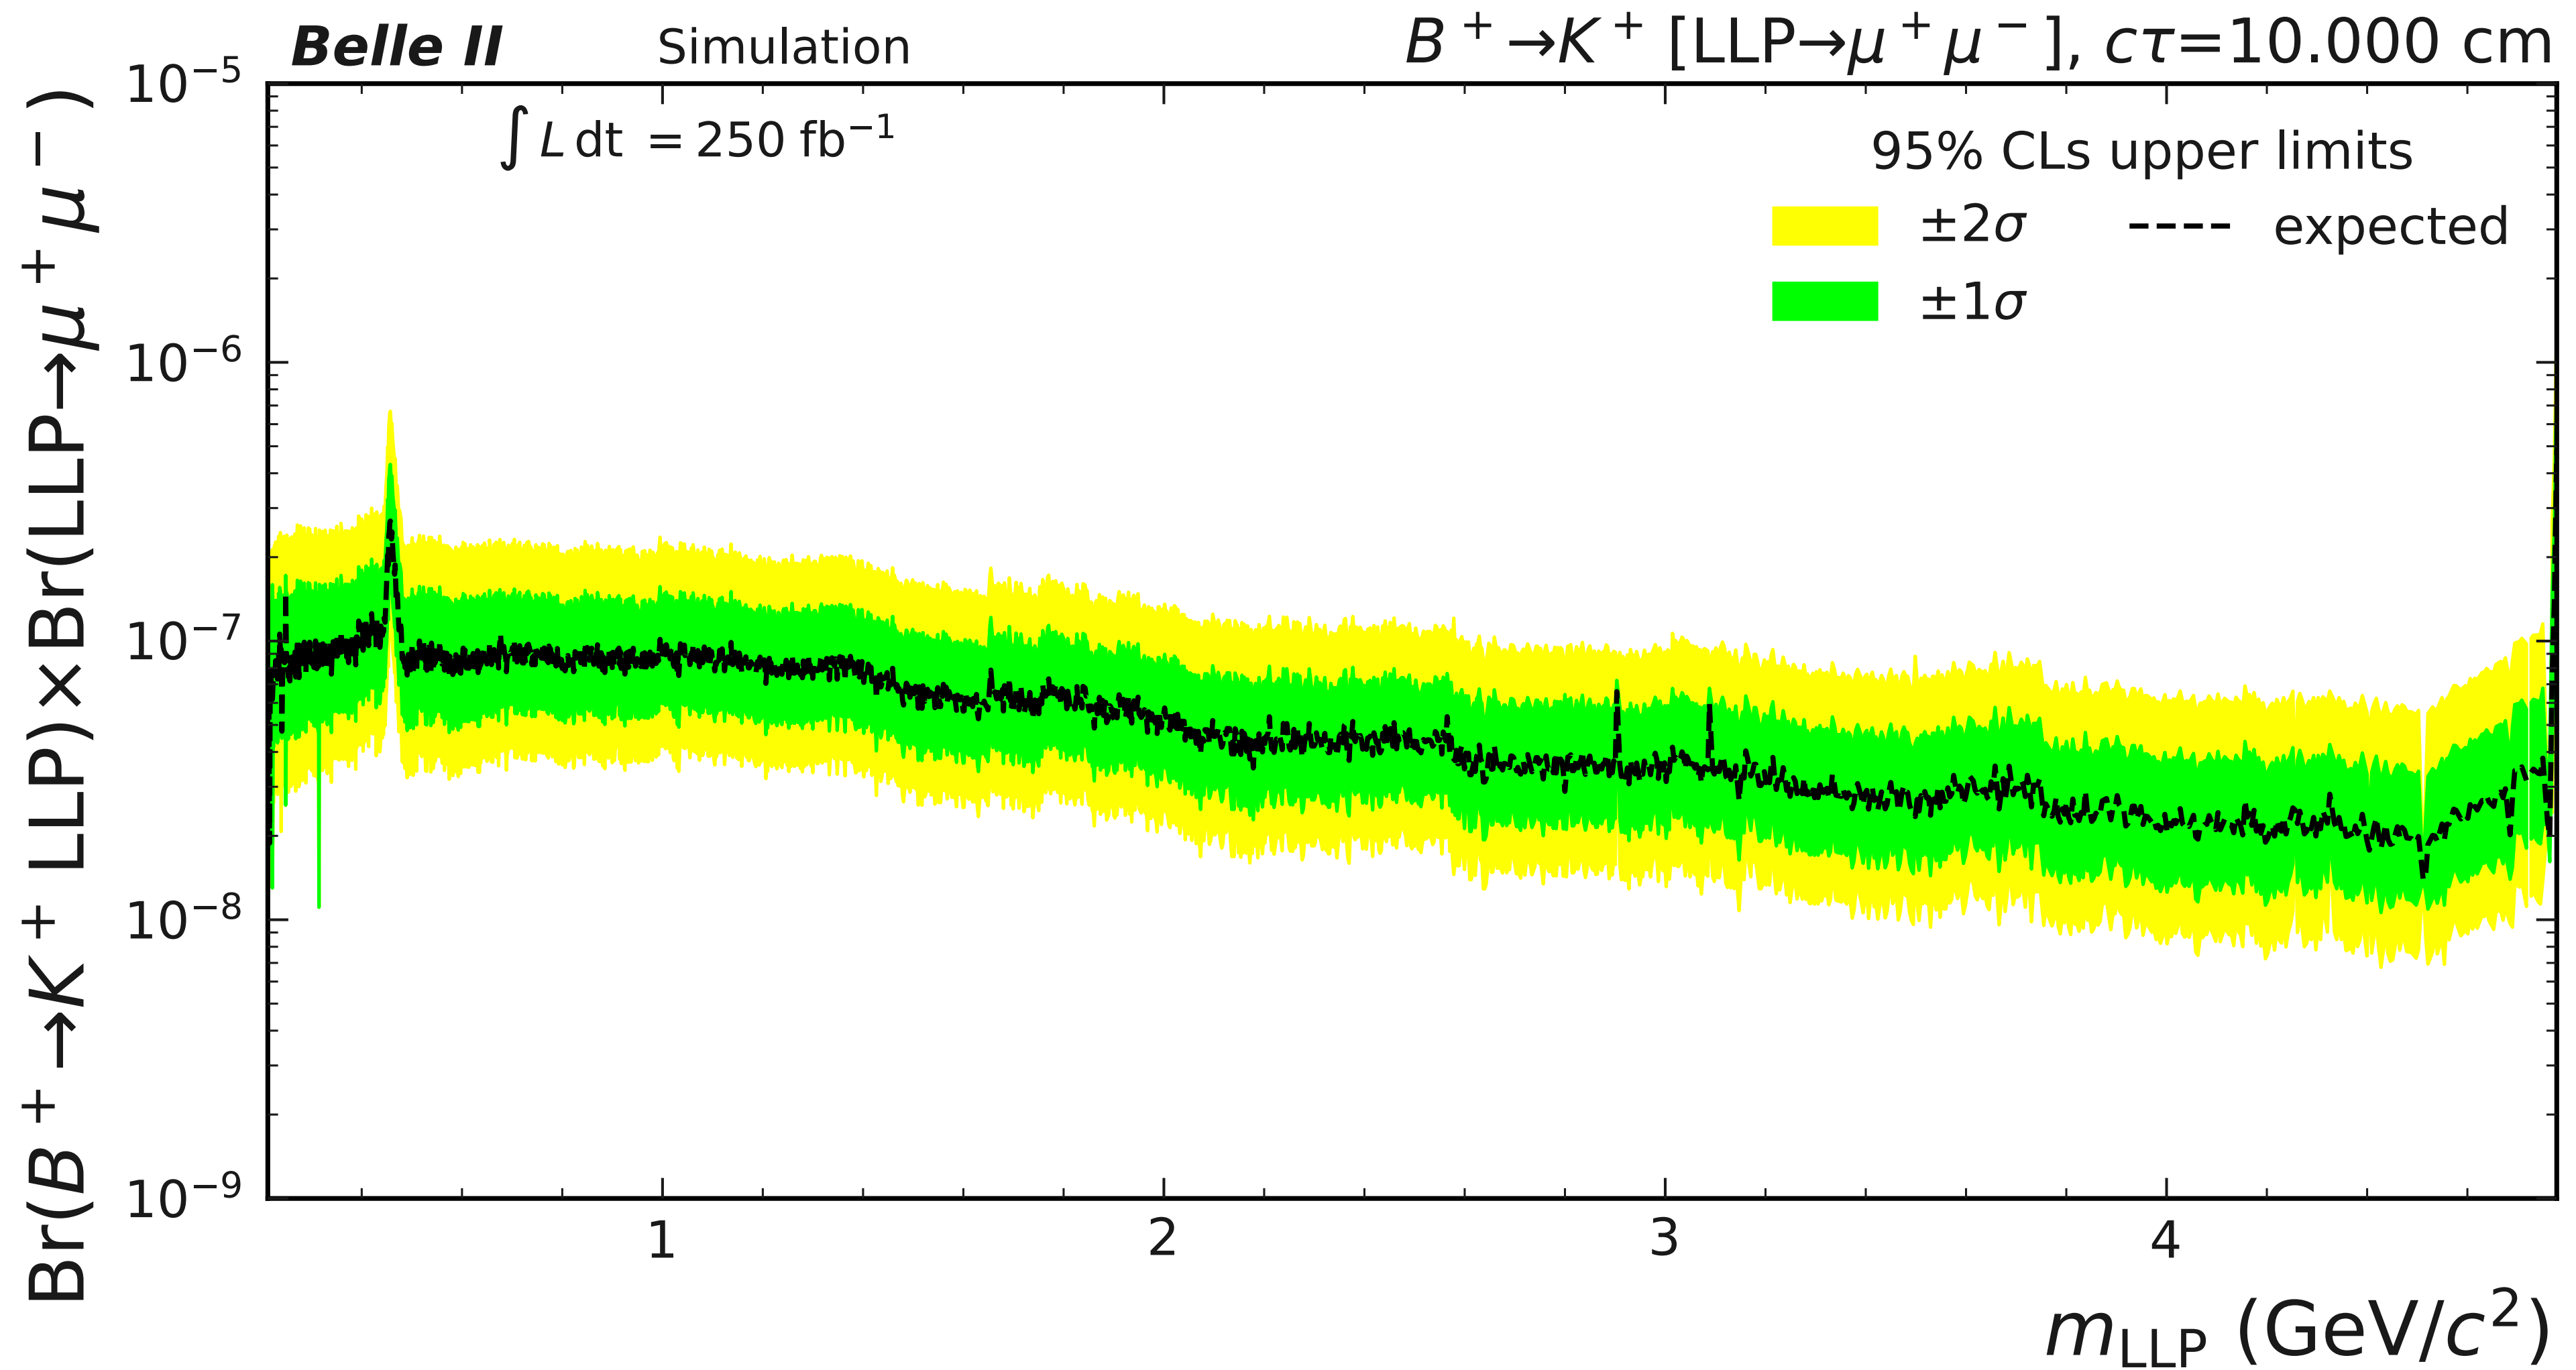

- Double sided crystal ball models **signal**
- First order Chebyshev polynomial models **background**

Signal extraction — simultaneous.

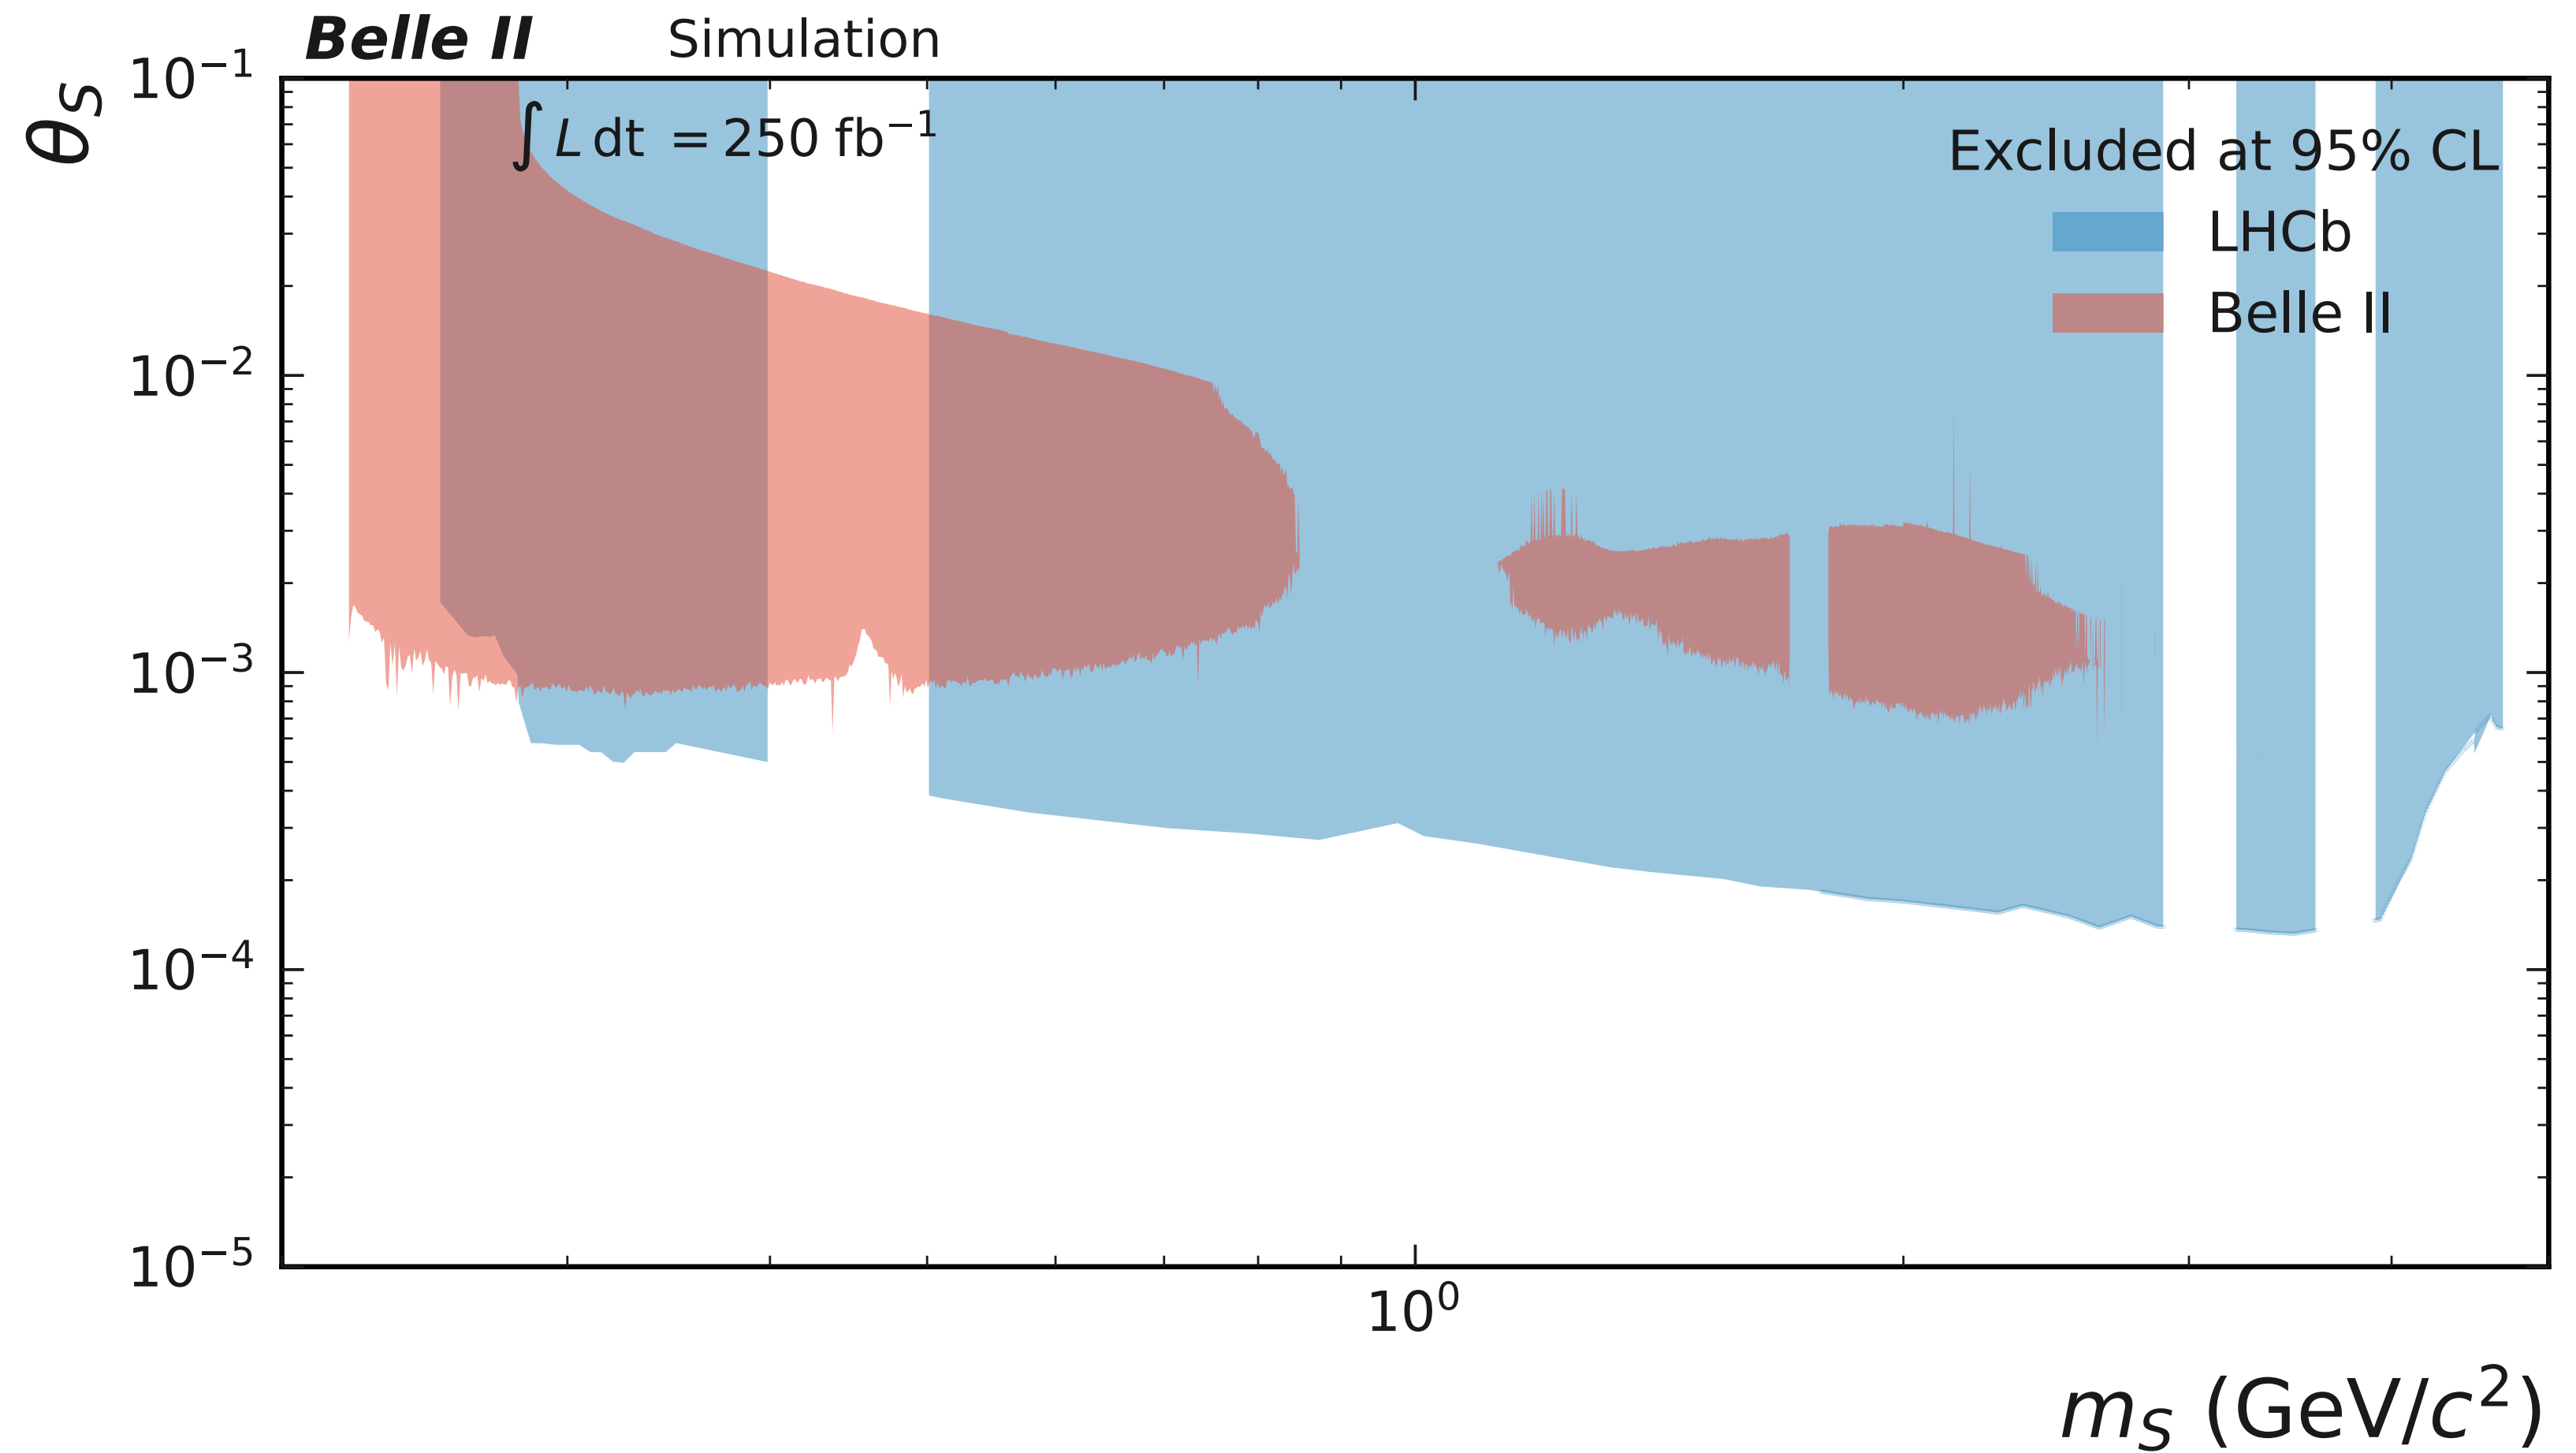

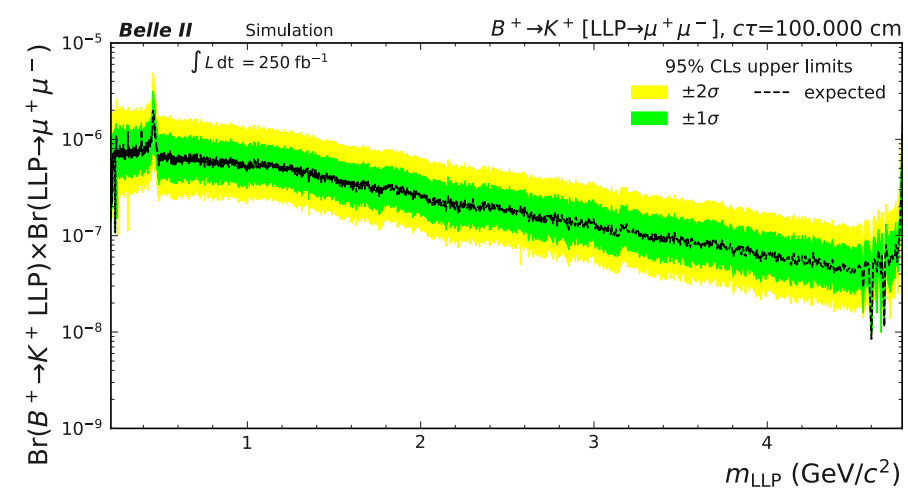

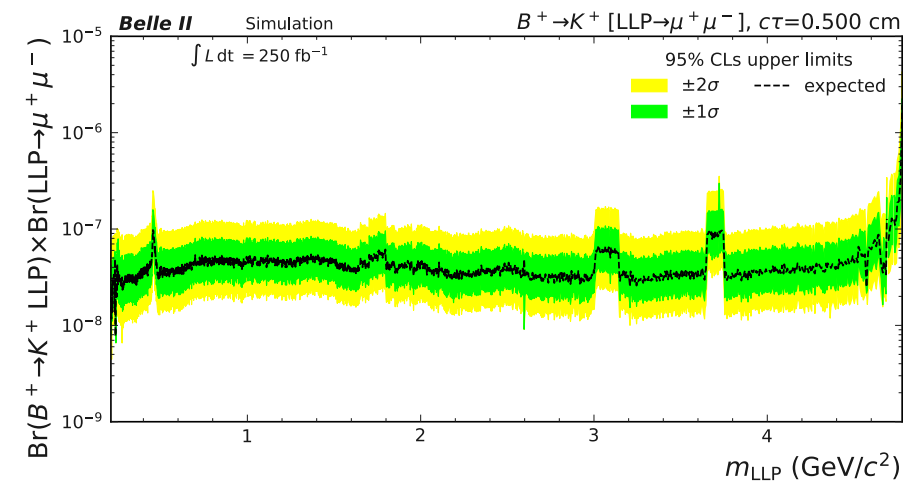

- Extract signal yield in all channels with a simultaneous fit
- Use model prediction for the signal branching fractions in different channels

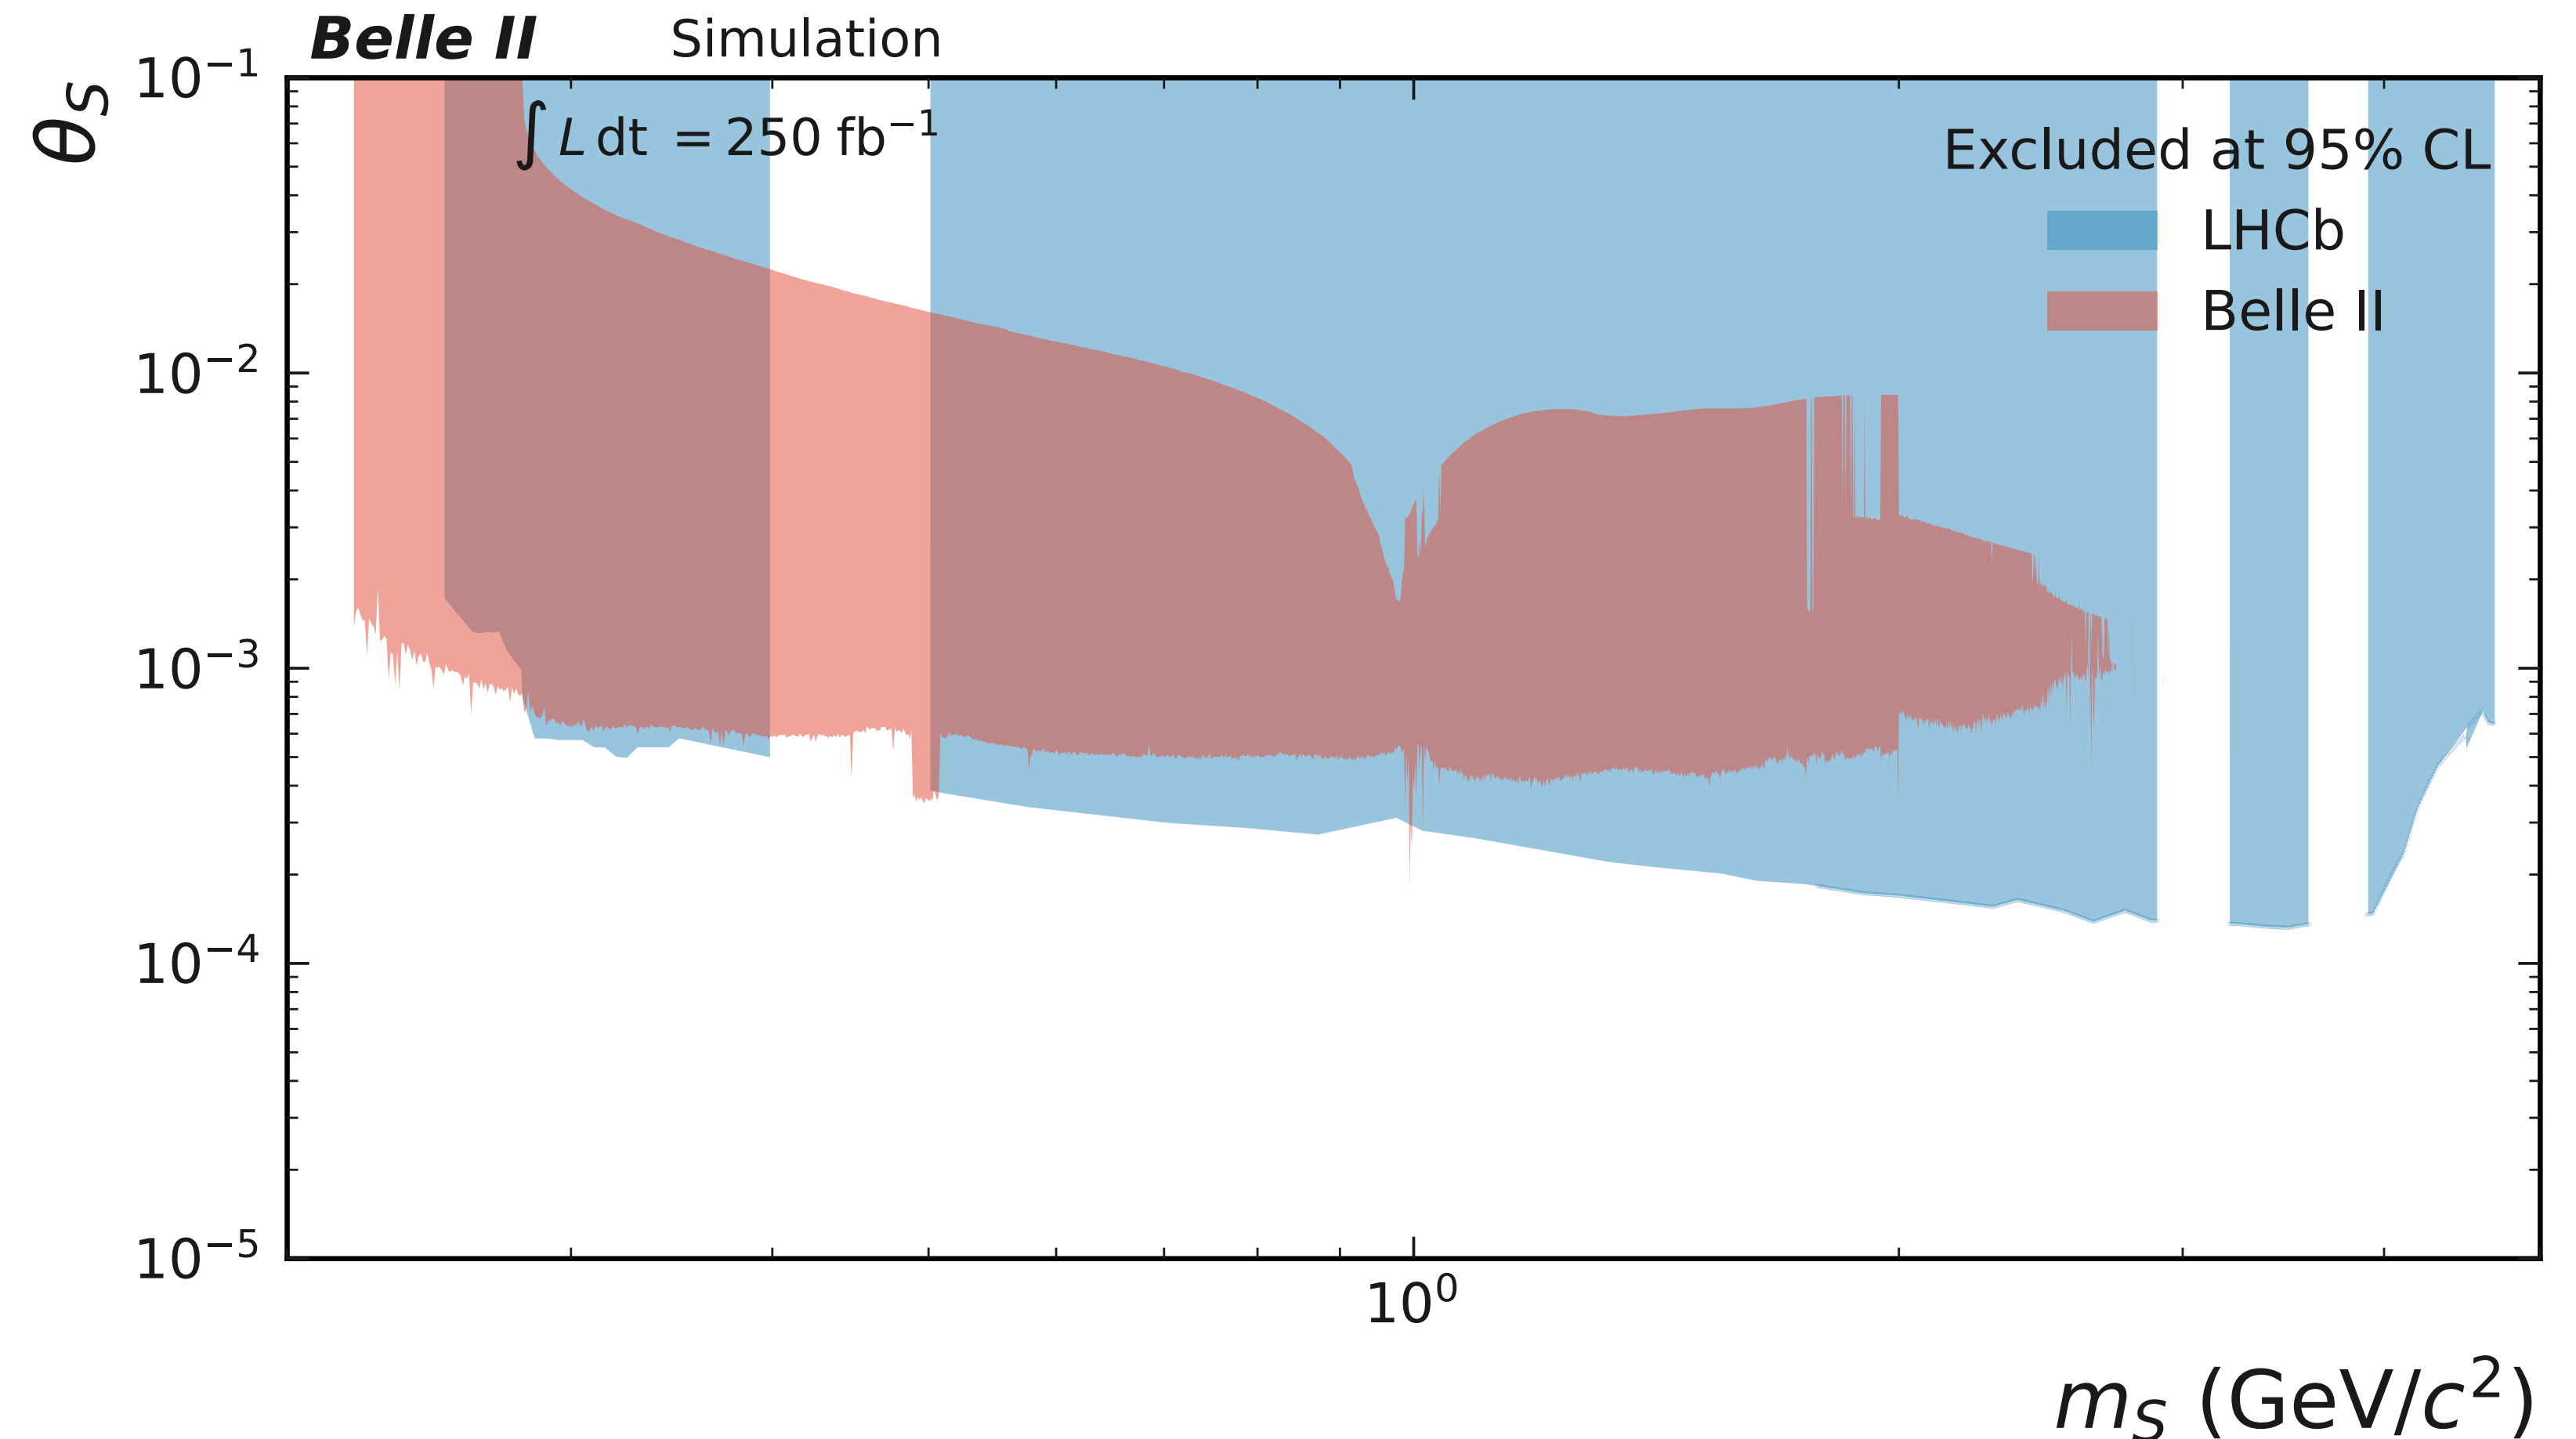

Upper limit on the mixing angle.

- Model constrained more strongly by combining information from multiple channels
- Expect best limits at low masses $< 280 \text{ MeV}/c^2$ and in the K_S^0 mass region

- Search for a **long-lived scalar** in $b \rightarrow s$ transitions [Internal note](#)
- In working group review — started studying sideband data
- Plan to publish using Moriond dataset expecting competitive results ~ end of the year
- Stay tuned ...
